Stop Chasing Coins That Have Already Pumped - 1STMAN

Channel: 1M Vault · Published: Jul 06, 2026 · Watch: https://www.youtube.com/watch?v=CyYniUDXuV4 Source: full transcript

📋 Executive Summary

Crypto success comes from patient early research, not chasing hype. Position yourself two steps ahead of mainstream attention — in low-profile, undervalued coins — before the crowd arrives and the gains are already gone.

📑 Contents

🎣 The Fishing Analogy: Why Chasing Never Works 2:29

- The presenter draws heavily on his background in coarse fishing (carp fishing) to explain the core mistake crypto investors make
- The best fishermen pick **one spot**, commit to it, and "bait their swim" — throwing in ground bait, maggots, sweetcorn repeatedly to attract fish over time
  - They start slow but fish eventually come to them
  - He personally had a secondary "tidbit" zone he fed throughout the day but didn't fish, then switched to it later when his main spot dried up — the fish had been building there undisturbed all day
- The losing fisherman pattern:
  - Sits for 2 hours, catches nothing
  - Sees a fish jump somewhere else, runs over there
  - Catches nothing, sees movement somewhere else again, runs again
  - Keeps chasing around the lake and never settles
- The crypto parallel is exact: people jump from Bitcoin → Cardano → XRP → whatever was mentioned today, never staying long enough to see results

📉 The Problem With Chasing Hype 4:47

- Everyone currently claims to be a crypto expert — the presenter openly admits he's a "casual crypto trader" who has researched for ~2 years flat and has no idea compared to top experts
- Example of the hype cycle:
  - BitBoy Crypto released a video about Frontier (FRONT) coin
  - It skyrocketed immediately after
  - Within one day, ~50 copycat YouTube videos appeared from other traders covering the same coin
  - By then, the move was already over
- One analyst was talking about Frontier **2 months earlier** — that's the person worth following
- People hear a coin mentioned and immediately pile in without independent research
- The pattern: "I'll put £1,000 into Bitcoin" → wait → small gain → "what else is there?" → chase Cardano → repeat

> "You've got to stop believing the hype of everything. At some point you have to simmer down, take a breath, and go — what's reasonable?"

🪜 The "Two Steps Back" Framework 6:37

- Visualise a frontier line where everyone is standing staring at Bitcoin — then physically step back twice:
  - **Step 1 (one step back):** Ethereum, Cardano, XRP (SEC outcome uncertain), Polkadot (DOT), Synthetix — large coins still with meaningful upside, priced in the "second bracket"
  - **Step 2 (two steps back):** Ocean Protocol, Key, VeChain, Frontier — "hidden gems that nobody else really knows about yet," still priced at just a couple of dollars
  - **Even deeper:** Coins priced at fractions of a penny — "real deep stuff" that requires digging through Binance and DeFi ecosystems
- The 70-year-old neighbor signal:
  - Presenter was at his dad's house; the 70-year-old neighbor was talking about Bitcoin
  - Rule: **if your dad's 70-year-old neighbor is talking about a coin, it's time to get away from it**
  - Equivalent signal for Ethereum: if your mom's hairdresser just invested in it, you may have missed the best gains
- Frontier has been listed on Binance openly for a long time — a little research would have put you in early

💰 Realistic Gains: What to Actually Expect 9:20

- Bitcoin reality check for small investors:
  - To buy 1 BTC at ~$50,000, you need $50,000 invested
  - Even if Bitcoin hits $100,000 (doubles), you only make $50,000 gross
  - After tax, you might net ~$20,000 in actual gains

    - If you already had $50,000 spare, $20,000 is "not bad, but not life-changing"
    - To truly have $50,000 "spare," you'd need roughly $300,000 in your account
- Ethereum scenario (current price cited ~$1,800, presenter expects a move toward ~$10,000):
    - An investment growing from £1,000 to £10,000–£15,000 is "great for a newbie"
    - If ETH hits £75,000/coin with favourable events, after-tax gains in GBP are roughly ~£40,000 — "about a year's wage"
    - Life-changing on a small scale, but "not going to buy you a yacht and a house"
- His argument for why ETH still has upside: it has been **held back by institutional money** for a long time; once that pressure releases, it should pop
- DOT and Synthetix: he believes they'll reach ~$1,000 each, but if they're already at $20, you need to invest at least $10,000 to see meaningful gains

🔍 The Real Strategy: Research What's Next 12:02

- Use early, safer coins (ETH, DOT) to **get on the board** — build your portfolio from £1,000 to £10,000–£20,000
- Then deploy that capital into deeper research plays
- What to research:
    - What's coming next in DeFi?
    - What's happening with NFTs?
    - What projects are connected to coins already gaining traction?
    - Where is the world heading?
- Specific example the presenter gives:
    - Everyone is watching **Synthetix** → he is watching **Linear (LINA)** — Synthetix's ecosystem token, same concept, one level deeper
    - Everyone is watching **Polkadot** → he asks: what is the next project Polkadot is releasing? (specifically mentions parachains launching "in the next couple of days")
- Amazon/hoverboard analogy for late movers:
    - Seeing ads for "sell on Amazon" courses and wondering if the market is saturated
    - A friend made ~$250,000 flipping hoverboards during a Super Bowl promotion — **8–9 years ago**
    - "You've either got to be one of the first movers or the best at doing it"

🐕 Dogecoin and Missed Opportunities 12:24

- Dogecoin was the right play **11 months ago** when it was a fifth of a penny
    - At that price, percentage gains were enormous and people made fortunes
    - Now it's a "joke coin" that only popped by sheer luck due to its tiny starting price
- Presenter's honest take: "I missed Bitcoin. Am I going to get involved now? Not really."

    - He wouldn't want to invest £250,000 to only own ~5 coins
    - Exception: if he had £10 million spare, he'd put it straight into Bitcoin to reliably double it — but "unless you're working for Morgan Stanley, those news articles aren't for you"
- Key mindset: sometimes you have to **lick your wounds, accept you missed it, and move on** to what's next

🏆 The Endgame: Plant Your Flag Early 10:52

- The game-changing strategy in full:
    - Identify coins few people know about
    - Invest slowly and build a position over time
    - Wait patiently while the mainstream catches up
    - When someone eventually says "have you heard about this new coin?", you can say "yeah, I've been in it for 3 years"
    - Result: potentially **£4–5 million overnight** when the coin goes mainstream
- "It's all about the percentage gains, not the price or the fame of the coin"
- The prep work analogy: put polaroids on, look under the water, drop bait in the swim the night before, arrive at 5:00 a.m. to guarantee your spot
- Always ask yourself: **if you think you're ahead, go one more step deeper** — you always want to be two steps ahead of the crowd, not one
- Coins specifically mentioned as current "two steps back" plays: Ocean Protocol, Key, VeChain, Frontier, Linear (LINA)
- Coins mentioned as "one step back" (still viable but more known): Ethereum, Cardano, XRP, Polkadot (DOT), Synthetix
