The 3 Decisions That Took My Business From $350K to $700K/Month

Channel: Tim Luong · Published: Oct 20, 2026 · Watch: https://www.youtube.com/watch?v=XvKnt2SJHVg Source: full transcript

📋 Executive Summary

Tim Luong shares a three-part PPP framework — Product/Pricing, People, and Pipeline — showing how targeted, compounding decisions (not 50 tactics) doubled his business revenue from $350K to $700K per month.

🧭 Introduction: Why Fewer Decisions Beat More Tactics 0:00

- Opening premise: you probably don't need 50 new strategies to scale your business
  - Most likely just 3 good decisions will get you to your goal
- Tim's credential: built a business from zero to 8-figure annual revenue
- Key insight about business growth: **it is never linear**
  - You can spend 6 months improving 20 different things and see almost no change
  - Or change one thing in your funnel, team, or offer and the entire business leaps forward
- The framework introduced: **PPP**
  - P1 = Product & Pricing
  - P2 = People
  - P3 = Pipeline

💰 P1: Product & Pricing — Charge More, Scale Smarter 0:41

- Common founder misconception: to double revenue you need double the customers

    - Often untrue — the problem is not market size, it is economics
- Tim's personal pricing evolution for his in-person trading workshops (3-day class, same core offering):

Stage	Price
First class	$1,500
Second class	$2,500
Subsequent classes	$3,500 → $4,500
Final in-person price	$5,800

- The price nearly **quadrupled in ~6 months** with the same fundamental product
    - Value was added: started recording classes and giving students lifetime access to recordings
    - This reframed the offer from "3-day event" to an ongoing program
- Surprising result: conversion rate did not drop — it actually increased
    - Reason: higher price signals premium quality in the market
- Key math illustration on why pricing beats volume:
    - At $1,500 → needed 100 customers to make $150K
    - At $5,800 → needed only **26 customers** to make $150K

    > "Sometimes you're trying to solve a volume problem, but it's actually a pricing problem."

- How Tim removed the scaling ceiling by going online:
    - In-person cap: max 25 students per class in San Jose, CA → maximum ~$150K/month (one class/month limit)
    - Online pivot at ~$5,800: no student cap, evergreen format, year-long access, weekly live group coaching Q&A calls (2 hours)
    - Overhead dropped: no venue rental, catering, or logistics costs
    - 20, 100, or 200 students all served in the same format with the same instructor time
    - Result: business crossed **$1 million/month**
- Framework questions to ask yourself:
    - How can you raise your prices?
    - What must you add to the offer so it stands apart from competitors?
    - How can you structure the offer so you could serve 100× customers tomorrow without proportionally higher costs?

👤 P2: People — One Right Hire Can Double Revenue 4:11

- The most dramatic recent example Tim shares: **monthly cash revenue went from $350,000 to $700,000 in ~60 days** from a single hire

- Founders typically think about headcount linearly: 10 employees = 2× the output of 5 employees
  - Talent doesn't work that way
  - In high-leverage roles, one exceptional person changes the output of everyone around them
- The situation before the right sales leader was hired:
  - Business was stuck at $350K/month
  - Sales team had no real culture — everyone worked in isolation
  - No team meetings (people simply didn't show up)
  - No structured call framework
  - No regular training
  - No personal development
- What the new sales leader brought:
  - Structured sales training program
  - New energy and motivation across the team
  - Coached individuals toward their personal goals
  - Built a genuine team environment
  - Brought in additional talent from their own network
- Outcome: the **same sales team** (6 reps underneath the new leader) went from **$350K → $700K/month within 60 days**
- Why this hire had disproportionate impact:
  - Affected culture, training, and every team member's results simultaneously
  - Was not merely additive (= one more rep) — it was multiplicative
- Smaller-scale example for a solopreneur doing $50K–$100K/month with one VA:
  - Hire one skilled closer
  - That closer generates $75K–$100K on their own
  - Founder's total revenue jumps to $150K/month — effectively doubled
  - Bonus: founder gets time back, can focus on growth rather than sales calls
  - Next leverage: hire an operator or fulfillment specialist to free the founder further
- 80/20 rule for talent: don't think about adding a body — think about who can create **disproportionate value** in sales, marketing, leadership, or product

🔧 Hiring Framework: Finding the Constraint-Solver 6:37

- Step-by-step process Tim recommends:
  - Step 1 — Identify your biggest business constraint: what single thing, if solved, would double the business?
  - Step 2 — Write it down clearly
  - Step 3 — Use ChatGPT: ask "What role or position handles this problem? What is that job called?"

    - Step 4 — Define the scorecard for that role: which specific numbers define success?
    - Step 5 — Go find someone who has **already achieved those results elsewhere**
- Critical hiring rule: do not hire based on likability, familiarity, or impressive résumé alone
    - Hire someone with **proven results** solving the exact constraint you face
- Common dangerous trap: founders keep adding people to solve a problem that is not actually a people problem
    - Tim's example: one month his team had spent $100K over marketing budget yet got the same number of leads they could have gotten for far less
    - Root cause was not the team size — it was that the team was focused on the **wrong problem** (fixing ads and VSLs) while the real issue was a neglected landing page

📊 P3: Pipeline — Fix the Leak Before Adding More Water 8:01

- Common founder assumption: "marketing problem = I need more qualified leads"
    - Sometimes true, but often a small hole in the funnel is destroying efficiency
- **Lesson 1: Feedback Loop Speed**
    - Old approach: shoot 15–20 ads once or twice per quarter → send to production → edit → test
    - Problem that resulted: an entire quarter where all new ads failed AND existing ads stopped working simultaneously
    - Cost per qualified lead **doubled** — wiping out all profit regardless of how well the sales team closed
    - Root cause: the feedback loop was far too slow to course-correct
    - New approach: launch **new ads every week**, maintain a pre-tested bank of proven ads always ready
    - Result: never caught flat-footed without working ad creative
    - Principle: the best-performing companies constantly work to **shorten their marketing data feedback loops**
- **Lesson 2: Fixing the Right Part of the Funnel**
    - Tim's team was baffled — ad costs were rising again but the ads and VSL both looked great individually
    - The team was analyzing each asset in isolation (siloed thinking)
        - Ads: metrics looked great
        - VSL: metrics looked great
        - VSL conversion rate: looked great
    - The overlooked piece: the **landing page connecting ads to VSL**
        - Expected landing-page conversion rate: ~30%
        - Actual rate: had dropped to **20%**
        - That 10-percentage-point drop = a **50% reduction in leads** and a doubling of cost per qualified booking
    - Fix: Tim personally wrote several new headline variants, tested them, restored conversion rate back to **30%**

- Impact: cost per qualified booking cut in half; lead flow returned to KPI targets
- Key lesson: "Sometimes you don't need more leads — you just need to stop wasting the leads you already have."

🔁 The Compounding Math: How PPP Multiplies Together 11:32

- Tim's core argument: asking "should I fix product OR people OR pipeline?" is the wrong question
  - Real power = understanding how all three interact and compound
- Illustrated with a concrete example:

Lever	Before	After
Qualified opportunities/month	100	130 (+30%)
Close rate	20%	26% (+6 pts)
Price per deal	$5,000	$6,500 (+30%)
Monthly revenue	**$100,000**	**$219,180+**

- Each individual improvement was modest and realistic:
  - Product: improved offer enough to justify raising price from $5K → $6.5K
  - People: hired a skilled closer who lifted close rate from 20% → 26%
  - Pipeline: tightened feedback loop to generate 130 vs. 100 qualified opportunities
- Combined effect: **more than 2× revenue** — without any single dramatic change
- This is the compounding leverage of PPP working together

✅ Three Questions to Ask Yourself Right Now 12:35

- Tim's closing framework — three diagnostic questions every founder should ask:
  - **Question 1 — Product:** "If I was not allowed to acquire any new customers, how could I dramatically increase revenue from my existing customers?"
  - **Question 2 — People:** "If I could add just one extraordinary person to my company tomorrow to remove the biggest and most important bottleneck, who would that person be?"
  - **Question 3 — Pipeline:** "If product and team couldn't change, where is the single biggest flaw in my customer acquisition process — fixing which would dramatically increase the number of leads I get OR convert the leads I already have more efficiently?"
- Final question (most important): **"What is your real constraint right now?"**
  - You may be only 3 decisions away from doubling
  - Sometimes you may only need **1 decision**
