

Watches Are Mini Bank Accounts On Your Wrist

Channel: Onem · Published: Sep 11, 2026 · Watch: <https://www.youtube.com/shorts/bX9klvdcUAE> Source: full transcript

Executive Summary

The host reframes expensive watches not as vanity purchases but as portable emergency liquidity — roughly \$10K of instantly barterable value always on your wrist, ready to get you out of any stranded, cashless situation.

- 🕒 Background: The Watch He Owns & His History With Watches
- 🔒 The Security Sweet Spot: Why \$10K Is the Right Price
- 🏦 The Core Thesis: A Watch as a Mini Bank Account
- 🚗 Real-World Barter Scenarios

Background: The Watch He Owns & His History With Watches 0:00

- The host was previously **against** watches and never saw the point in owning multiple or expensive ones
 - His view shifted after a conversation with a close friend and ONM member
- He now owns a Breitling — he believes it's the Super Ocean model but admits he rarely pays attention to the details
- He has an ongoing practical problem: his fingers are too big to pull out the crown and wind it
 - As a result, the watch stops running regularly
 - Every time he visits Madrid, he has a person there wind it back up for him
- Despite low emotional attachment to watches, he appreciates the strategic value of wearing one

The Security Sweet Spot: Why \$10K Is the Right Price 0:23

- His recommended price ceiling for a watch is **\$10,000**
 - Going above that turns the watch into a security liability — it makes you a target
- His reasoning uses a criminal's cost-benefit logic:
 - A would-be thief sees a physically imposing person wearing a \$10K watch
 - The risk calculation: get beaten up badly for \$10K vs. potential prison time — the reward doesn't justify the risk
 - His view: "It's got to be risk and reward. The risk of this isn't worth the reward."
- He contrasts this with someone like Jon Jones (elite fighter with security):

- Someone at that level could reasonably wear a \$20,000–\$30,000 watch
- The host, lacking full-time security, keeps it at the \$10K level as a practical safety cap

The Core Thesis: A Watch as a Mini Bank Account 1:31

- The insight he says **nobody talks about**: a quality watch is liquid, portable value you carry at all times

"When you're carrying a watch on your wrist, you've got a mini bank account. You're never without money."

- Scenario that illustrates the point: being completely stranded with no phone battery, no card, and no cash
 - Examples given: Tunisia, the hills of Pakistan, anywhere remote or unexpected
 - In those moments, the watch converts the "I'm broke and stuck" situation into "I have ~\$10K of tradeable value"
- The watch currently sits at around **\$9,000** in his estimation (he corrects himself mid-sentence)
- Key benefit: it is always accessible, requires no infrastructure (no signal, no bank, no ATM), and can be exchanged on the spot

Real-World Barter Scenarios 2:17

- **Taxi across the country**: Stranded in Scotland needing to reach London (~5–6 hour drive) with no money — offering the watch to a taxi driver would get anyone to make that trip, no questions asked
 - "There's not a taxi driver in the world that would not take that watch to take you anywhere across country."
- **Private jet**: Even a pilot or charter company would at minimum seriously consider a \$10K watch as payment in a genuine emergency
- **The floor case**: You wouldn't trade a \$10K watch for a coffee — but in a life-or-death situation, the option is there
- Core takeaway: whatever situation you're in, you always have a fallback asset — the watch is a last-resort financial tool, not just an accessory
