Why Most People Quit Right Before Success

Channel: Brandon Carter · Published: Oct 30, 2026 · Watch: https://www.youtube.com/shorts/NwyBkNsa50Q Source: full transcript

📋 Executive Summary

Success follows an exponential curve, not a linear one. People quit during the slow early phase — the "Quit Zone" — expecting linear returns. Those who push through eventually reach the "Thriving Zone," exceeding even their own expectations.

- 🏆 The Thriving Zone
- 🔑 The Key Takeaway: Commitment Over Switching

📈 The Misconception: Linear vs. Exponential Success 0:00

- Most people expect success to be **linear** — the more time you invest, the more proportional success you get
  - This mental model is wrong and sets people up to quit prematurely
- In reality, success grows **exponentially**
  - Early on, progress is slow and barely noticeable
  - Then, after enough time and effort, momentum builds and things genuinely take off
- The gap between the expected linear curve and the actual exponential curve is where the danger lies
  - People interpret early slow progress as failure, when it is actually the normal early stage of any exponential curve

🚪 The Quit Zone 0:23

- The "Quit Zone" is the specific point on the exponential curve where most people give up
  - It occurs during the flat, slow early phase — before the curve bends sharply upward
  - Because results don't match linear expectations, it feels like the effort isn't working
- This pattern may be a recurring story for many people
  - Try something new → expect quick linear results → results take longer than anticipated → quit
- The painful irony: quitting in the Quit Zone means stopping right before the curve accelerates

🏆 The Thriving Zone 0:23

- Those who push through the Quit Zone eventually enter the "Thriving Zone"
  - This is when results surpass even the original expectations
  - Not just meeting the linear goal — but exceeding it by a wide margin
- This explains why award winners and highly successful people often say things like:
  - "I never expected this."
  - "I never thought I'd achieve this."
  - "I never thought it would turn out this way."
- They aren't just being humble — they genuinely expected a modest linear outcome, stayed the course through the hard phase, and ended up far beyond what they imagined
  - They passed through the Quit Zone, it was difficult, then one day things clicked and took off

> "That's what they're talking about — because they expected this [linear result]. They went through the Quit Zone, it was hard, then one day things started taking off, and they ended up better than they expected. Because that's how success works."

🔑 The Key Takeaway: Commitment Over Switching 1:10

- The solution is to **stay with one thing long enough** to exit the Quit Zone — especially if you genuinely believe in it
- The failure pattern to avoid: constantly switching directions before any single path has time to compound
  - Example given:
    - Start Amazon FBA → not rich in 20 days → quit
    - Start a faceless YouTube channel → not rich in 2 weeks → quit
    - Start forex trading → not rich quickly → quit
  - If you had stayed with any one of those, it could have succeeded
- Enough effort over a long enough period of time is the formula
  - Brandon states he personally knows people who made **millions** doing the exact things the listener quit
  - "I bet if you named anything you quit, I probably know someone who made millions doing it — but they went through the Quit Zone and came out the other side."
- The actionable principle: when you start something new, commit to staying with it past the slow early phase rather than treating slow early results as a signal to pivot
