

Getting Ripped Made Me Rich EP 310

Channel: Brandon Carter · Published: Jun 26, 2026 · Watch: <https://www.youtube.com/watch?v=2tAINB5SRJ0> Source: full transcript

Executive Summary

Brandon Carter teaches how to monetize a personal fitness transformation through online coaching, breaks down current market conditions with chartist Greg, and kicks off a 30-day peptide experiment targeting single-digit body fat.

Intro & Sponsors 0:50

- Episode 310 of the Victory Talk podcast, aired Tuesday/Thursday at 5:00 PM Eastern
- Three main topics teased:
 - How to make money as an online trainer
 - How to get ripped
 - How getting ripped can directly make you rich
- Brandon's framing on motivation:
 - People stuck in "purgatory" — life not good enough to love but not bad enough to change
 - Classic motivation framework: moving toward pleasure OR away from pain
 - His approach this episode: **increase the pleasure** side (show how fitness = money) rather than just "twisting the knife" on pain
- Humorous fake sponsor: "Thought Repellent" — a spray engineered to repel "hoses, skezes, skanks, and hood rats" while smelling great to good women; crowdfunding goal to have it out by Fourth of July

Sponsor 1: High Ticket Trainer Live Training 0:246

- Brandon hosting a **free live training Sunday, June 28th at 2:00 PM Eastern Standard Time**
 - Topic: how to grow an online fitness business using AI
 - Register via first link in description
- Student testimonials shared:
 - **Jen** — full-time nurse practitioner, two young kids, zero prior online training experience; made \$3,000 in first two months; hit her **first \$100,000 month** (approximately two years after joining)
 - **Will** — made **\$52,000 in his first four months** while holding a full-time job
 - **Angelo ("One Chess Apac Trucker")** — full-time trucker working 80 hours/week; found Brandon on Fresh and Fit, joined High Ticket Trainer; made his first **\$11,000 in six weeks**; now consistently puts up **\$10,000/month** and considering quitting trucking

Strategy: Makeover Madness — Turn Your Transformation Into Clients 0:719

- Strategy name: **Makeover Madness** — Brandon's trademarked method taught inside High Ticket Trainer
- Origin story — inspired by ex-NFL player **Steve Weatherford** (won Super Bowl with the NY Giants under Eli Manning, appeared on cover of Men's Health):
 - After retiring, Steve intentionally or inadvertently got fat, then publicly ran a "30-day metabolic reset"
 - Documented every single day on Instagram stories AND feed: daily check-ins, weekly before/after photos, every meal, every workout
 - After 30 days, revealed dramatic shredded result → immediately launched a paid program → "cleaned up" (made a lot of money)
- Brandon then did it intentionally with his friend Brian:
 - Spent ~two months deliberately getting as fat as possible
 - Got DEXA scans as baseline
 - Documented a **two-week extreme shred** in full detail
 - Launched the **"Terminator 2: Judgment Diet"** program off the back of the transformation
 - Result: **biggest single-day revenue he had ever made** at that point
 - That protocol is now free on YouTube — search "Brandon Carter extreme fat loss two weeks"
- Requirements to run Makeover Madness:
 - No millions of followers needed
 - No certification needed
 - Only need: **your own origin story + documentation**
 - Works even if already in decent shape; works especially well if currently out of shape
 - The transformation doesn't have to be extreme — going from "super fat to regular fat" is enough
 - "A fat person looks at me and thinks they can never look like that. But if you go from regular fat to just in good shape, you'll be more relatable."

- How to execute the strategy step-by-step:
 - **Step 1** — Announce publicly from Day 1: "This is Day 1 of me losing 30 pounds in 90 days" (pick 30–90 day window)
 - **Step 2** — Document every day: daily check-ins, weekly before/after photos, meals with explanations (not just what you ate — explain *why* and how it fits your plan), workouts
 - **Step 3** — Post on both Stories and feed; goal is NOT to go viral — just engage your existing audience, even under 1,000 followers
 - **Step 4** — Brand it like a series: name it something like "30 Days of Getting Ripped" or "My 4-Week Rebuild"
 - **Step 5** — Teach along the way: don't just show progress; when you lose 5 lbs make a video explaining *how* you lost 5 lbs
 - **Step 6** — Start selling *before* you hit your final goal: e.g., after losing 10 lbs in 4 weeks, post "DM me the word '10' if you want help losing 10 lbs in the next 4 weeks exactly how I did"
 - **Step 7** — Use a DM script to close prospects on online coaching
 - **Step 8** — Once you hit your goal, post: "I'm looking for 5 people to coach through the exact same transformation — comment 'transformation' for details"
 - **Step 9** — Get clients wins → use their testimonials as marketing → scale

"A big mistake people make is waiting until they're in great shape to start their online fitness business. Bring people along the ride from Day 1."

Why Online Coaching Beats Cheap Programs (and In-Person Training) 1:306

- Why NOT to sell cheap digital programs:
 - Average program price: ~\$50
 - To make \$10,000/month at \$50/program = need to sell **200 programs every single month** to 200 *new* people
 - "Most of you have never sold 200 of anything, any time."
- The online coaching math that works:
 - 25 clients × \$80/week × 52 weeks = **\$104,000/year**
 - "There are probably 25 people following you right now who'd be excited to work with you."
- Why online coaching is actually a *better* product than in-person training:
 - Average in-person trainer charges ~\$100/hour (Equinox: \$250–\$300/hour; budget gyms: \$25–\$50)
 - In-person trainer only sees the client for that one hour; doesn't monitor diet at all
 - Online trainer monitors the client 23–24 hours/day: daily diet check-ins, macro/calorie tracking, accountability on sleep, workouts, and food
 - **"You can't out-train a bad diet, but you can outdiet bad training."** Diet is the primary lever — online trainers control it; in-person trainers don't
 - Online coaching = cheaper for the client AND produces better results

- What clients are actually buying:
 - Not the meal plan (AI or YouTube can give them that)
 - Not the workout plan (same)
 - They're buying **accountability** — the guarantee that someone is making sure they actually do it
 - "That's why you're fat now. You know what to do but you're not going to do it."
- On certifications:
 - Brandon is certified with **NASM** (personal trainer and nutritionist)
 - "No one has ever asked me about my certification. Not once."
 - No law requiring certification to train people online
 - Certification only legally required for clinical dietitian work (treating disease) — and only in some states
 - AI can create better programs than a 30-year veteran trainer — so don't let lack of expertise be a barrier

Overcoming Imposter Syndrome & The Full Game Plan 1:696

- Imposter syndrome addressed directly:
 - You don't need to be Andrew Huberman
 - You're an accountability coach, not a scientist
 - Literally any workout plan + any diet plan + consistent execution = results for the average person
 - Example: "Tell someone to do pull-ups, push-ups, lunges, walk 20,000 steps/day, track their diet — they'll get in amazing shape."
 - "You just need to be a few steps ahead of them."
 - Brandon admits his early photos embarrassed him looking back — but he still made good money and eventually **made his first million dollars as an online trainer**
- Imposter syndrome disappears once you get your first client a win — focus hard on early clients
- Full condensed game plan:
 - Start documenting transformation from Day 1
 - Engage people who DM you during the journey
 - After hitting a milestone (not even the final goal), offer coaching via DM script
 - Accumulate testimonials → use as social proof → scale to 25 clients → six figures

Market Recap with Greg (Chartered Market Technician) 2:053

- Greg is a Chartered Market Technician (CMT) and co-host of Victory Trades trading group
- **Fear & Greed Index:**
 - Currently at **extreme fear**
 - Two ways to use it:
 - Trend indicator → bearish signal, stay cautious short-term
 - Contrarian indicator → "buy when there's blood in the streets"; historically, buying at extreme fear = up in 6–9 months

- Long-term investors: good time to DCA into S&P 500, NASDAQ; short-term: still in downtrend
- **Micron (MU):**
 - Crushed earnings → stock ripped **20% overnight**
 - But opened with a pump then formed an **evening star bearish reversal** — textbook short setup
 - Setup: large gap up → move up → indecision candle (doji/star) → break below low of day → short entry, stop above high of day
 - Micron's weakness infected broader market sentiment
 - **QQQ dropped 3% in 30 minutes** following this — "it takes the stairs up and the elevator down"
- **Apple (AAPL):**
 - Down **6% on the day** — classic bear flag (drop → consolidation → breakdown)
 - Cause: Apple announced price increases across product line
 - Mac Neo (entry-level): \$500 → \$600 (20% increase)
 - MacBook Pro 16-inch base model: ~\$300 more
 - Greg's technical read: Apple was already breaking support before the news; news was the explanation, not the cause
- **Microsoft (MSFT):**
 - New daily lows; down **24% in the month of June** (month not yet over)
 - No bounce since June 1st
 - Victim of IGV (software sector ETF) weakness — big pump then roll over across the sector (ServiceNow, Oracle similarly affected)
 - Greg: "Due for a bounce, but does it bounce here or lower? Time will tell."
- **Netflix (NFLX):**
 - Continues breaking down since April earnings — even though they *crushed* earnings
 - Brandon's take: "maybe just overvalued and hot"
 - Greg's lesson: "If something breaks support, don't be afraid to get out — you can always get back in"
- **Bitcoin (BTC):**
 - Greg: "I think Bitcoin's going to go through a lost decade at this point."
 - Possible short below **\$57,000** via August puts on IBIT
 - Support analogy: "Think of support like glass — first hit probably won't break it, second leaves a crack, keep hitting and it shatters"
 - Brandon had been dollar-cost averaging Bitcoin but got out
- **Ethereum (ETH):**
 - Similar to Bitcoin; tends to bottom *before* Bitcoin
 - If ETH has a strong green day while BTC is just slightly green → signal of a potential bottom
- **NBIS:**
 - Greg's top long-term stock pick: "If someone asks me the one stock to buy for the future, NBIS."

- Greg looking to **load up again at \$215–\$220** (10–15% pullback from current levels)
- Requires tolerance for volatility
- **S&P 500 (SPY) — potential topping formation:**
 - Possible head-and-shoulders pattern forming; if it breaks below mid-June pivot, could flush 5%+
 - Greg's stance: neutral June/July — buy oversold, sell overbought, don't chase big trends
- **Sectors in rotation:**
 - **Healthcare (XLV)** — defensive, looking strong; Greg considering calls on UNH
 - **Industrials (XLI)** — hit all-time highs today; Greg's earlier Caterpillar (CAT) call up **23%** since he flagged it near the pennant
 - XLI trade idea: buy the dip at **176–178** (gap support levels); sell 175 put / buy 170 put credit spread expiring end of July (~80% probability of making ~\$100, risking ~\$400)
 - **HIMS** — peptide/healthcare space, breaking out and holding; Greg considering calls
 - **XLB (Materials)** — ascending triangle forming (higher lows, flat top); speculative entry possible
 - **XLC (Communications = Netflix + Google + Meta)** — falling out of favor; Greg cut his long when it broke below 200-day MA
 - **Russell 2000 (IWM)** — hit all-time highs today (broadening of rally) but forming a **rising wedge** ("looks like a slice of pizza") — historically breaks down on SPY/QQQ/Russell, never seen it go bullish on those three
 - **XLF (Financials)** — short-term short candidate, could drop 1–2%
- **SMH (Semiconductor ETF):**
 - Long-term strong pick; on the **weekly chart with 200-period MA**, every touch of the 200MA over the last 10 years has been a massive buy opportunity
 - Last touch (April of prior year): buying then would have returned **~275%** today
 - ETFs preferred over individual stocks for long holds because they self-rebalance
 - Currently forming a possible **hanging man** on the weekly — caution short-term
- **Gold:**
 - Out of rotation; Greg doesn't expect it to pick up until **2027**
 - Could drop another **13%**; if it does, Greg will buy leap calls
 - The 200-day MA strategy does NOT reliably work on gold (only confirmed on SMH and SPY)
- **TSM (Taiwan Semiconductor):**
 - Greg's favorite individual semiconductor stock
 - Greg caught breakout from \$450 to \$476 for Victory Trades members
 - Would buy calls again on a ~6% dip
- **Michael Saylor:** currently being sued by investors
- Victory Trades performance that day:
 - Greg started down **\$5,000**, cut losses, finished **+\$1,000** (net \$6,000 swing)
 - Multiple Apex prop firm payouts hit his bank account

- Member wins: Prei +\$1.5K, Swift Jacob +\$1.1K, Elpado +\$76, PJ +\$4K–\$4.5K
- Differentiator: Victory Trades posts entries AND exits AND contract size — unlike other groups that only post entries and profit screenshots

Roth IRA ETF Recommendations 3:311

- Super chat question from Alexander Lopez: "Best stocks for a Fidelity Roth IRA?"
- Greg's framework for retirement accounts:
 - Focus on **ETFs**, not individual stocks, for long-term retirement
 - Individual stocks: hold 1–3 years max, maybe 5; ETFs you can set and forget for decades

ETF	Description	Risk/Reward
QQQ	NASDAQ 100 ETF	Higher risk, higher reward
VO	Mid-cap ETF	Slightly lower expense ratio than QQQ
SMH	Semiconductor ETF	Higher risk, strong long-term upside
DTCR	Data Center ETF	Good for next couple years of AI infrastructure growth
VTI	Total US Stock Market	Lowest risk, lower reward, true set-and-forget

- Key principle: **dollar cost average** — don't deploy all capital at once
- Roth IRA advantage: taxed on the front end, not on profits/accumulation
- Standard disclaimer: not financial advice, not an offer to buy or sell securities, charts have limitations, anything can happen
- Bitcoin cautionary tale: buying in February 2021 → break-even today after half a decade, underwater for most of the period

30-Day Peptide Challenge: Protocol & Plan 4:056

- Brandon announcing a **30-day peptide experiment** starting immediately, to be documented live and on YouTube weekly
- **Baseline stats:**
 - Age: 43 (turning 44)
 - Height: 6'2"
 - Weight: ~200–205 lbs
 - Estimated current body fat: ~10–12% (abs visible but wants to go further)
 - Diet: **strict keto for 10+ years**
 - On **Testosterone Replacement Therapy (TRT)** since just before age 40
 - Training since age 16
- **Goal:** Reach **5–6% body fat** while maintaining or ideally building muscle
- **The GLP-1 problem he's trying to avoid:**

- GLP-1 drugs (Ozempic, Wegovy, tirzepatide) can cause massive muscle and bone density loss
- Root cause: they obliterate appetite → people don't eat enough protein → muscle wasting
- "Ozempic face" — weight lost but look skeletal
- Celebrities/housewives lose muscle because they also don't lift heavy

- **Peptide stack:**

Compound	Type	Dose	Frequency	Purpose
Tirzepatide ("Tirzepide")	GLP-1 agonist	2.5 mg	Weekly injection	Fat loss / appetite suppression
Ipamorelin + CJC-1295	GHRH/GHS (growth hormone secretagogue)	200 mcg	Nightly, 5 days on / 2 days off, fasted	Anabolic shield — boosts GH and IGF-1
MOD GRF / MOD-C	Mitochondrial activator	5 mg	3x/week pre-workout	Mimics exercise; forces mitochondria to pull energy from stored fat
BPC-157 + TB-500	Peptide repair stack ("Wolverine compound")	Daily	Daily	Injury prevention and healing of lingering injuries

- **Daily rhythm:**

- Wake up → BPC-157 + TB-500 injection; MOD-C 3x/week pre-workout
- DEPA (possibly DHEA reference) in the morning
- Heavy compound training
- Final meal **at least 2 hours before bed**
- Right before bed → Ipamorelin + CJC injection (fasted state preferred to avoid insulin blunting GH release)

- **Keto advantage for the protocol:**

- Keto keeps blood glucose so low that his continuous glucose monitor (worn for a month) thought he was fasting
- Insulin spike blunts GH release — since he doesn't spike insulin on keto, the fasted-injection requirement may be naturally satisfied
- MOD-C synergy: his metabolism is already fat-adapted; MOD-C may amplify fat oxidation further or have no additional effect — "we'll find out"

- **Muscle retention rules:**

- **Protein:** minimum 1 g per lb of bodyweight; if appetite suppressed to the point calories drop to ~1,500 or below, increase to **1.5 g/lb (up to 300 g/day)**
- Easy protein hack if appetite is crushed: whey protein shakes
- **Training: lift heavy** during the cut — reduce reps, increase weight; do NOT do high-rep low-rest circuits ("you're asking your muscle to go away")
- Stick to **compound movements**

- Stay on **minimum effective dose** of tirzepatide — not trying to crush appetite completely
- Transparency note: Brandon has always disclosed everything — shared TRT journey, doctor interviews, blood work; same approach applies here
- "I don't know if it's going to work. Maybe nothing happens. Maybe it messes me up. Either way, you'll learn something from my experience."

? Super Chat Q&A [4:912](#)

- **Tyler (17, from England):** "I legally can't work more than 40 hours a week due to my age. Any advice? I don't want to sit around."
 - Brandon's advice: use the remaining time for side hustles — mow lawns, walk dogs, freelance work
 - May be difficult to start a formal business (in the US you need to be 18 to open an LLC)
 - Notes the irony: England limits work hours for 17-year-olds but allows drinking at 16
- **Alexander Lopez** (follow-up): confirmed he just wants to "set and forget" his Roth — ETF strategy confirmed as the right move
- Closing:
 - Victory Talk podcast airs every Tuesday and Thursday at 5:00 PM Eastern
 - Brandon plugs Victory Trades (futures/options trading community with Greg) — link in description
 - Reminder: free live training June 28th at 2 PM EST on growing online fitness business with AI
