

How to Get Shredded in 30 Days: 5 Steps

Channel: Brandon Carter · Published: Sep 29, 2026 · Watch: <https://www.youtube.com/shorts/WHJHU54dGHI> Source: full transcript

Executive Summary

Brandon Carter outlines five concrete daily habits — walking 20,000 steps, drinking 1–2 gallons of water, sleeping 7–8 hours, eating bodyweight × 10 calories, and consuming 1 g of protein per pound of bodyweight — to get lean within 30 days.

Contents

-  Step 1: Walk 20,000 Steps Every Day
-  Step 2: Drink 1–2 Gallons of Water Daily
-  Step 3: Sleep 7–8 Hours Every Night
-  Step 4: Eat Bodyweight (lbs) × 10 Calories Per Day
-  Step 5: Eat 1 Gram of Protein Per Pound of Bodyweight
-  Bonus: Personal Diet & Workout Plan

Step 1: Walk 20,000 Steps Every Day 0:00

- Walk 20,000 steps each day as the primary activity increase
 - An average person burns an **extra 800–1,000 calories** per day at this step count
 - This is presented as the single highest-leverage non-gym activity for fat loss

Step 2: Drink 1–2 Gallons of Water Daily 0:08

- Target: **1 to 2 gallons of water** every day
- Fat burning is described as a two-step biochemical process:
 - Step 1 — **Lipolysis**: fat cells break down into fatty acids
 - Step 2 — **Oxidation**: the body uses those fatty acids as energy
- Both steps require water to function properly
- Secondary benefits of high water intake:
 - Increased energy levels
 - Feeling of fullness, which helps control calorie intake

Step 3: Sleep 7–8 Hours Every Night 0:29

- Aim for **7 to 8 hours** of sleep per night without exception

- Critical warning: being in a calorie deficit is not enough on its own
 - If you are in a deficit but not sleeping enough, your body shifts from burning fat to **burning muscle instead**
 - Result: you lose the wrong tissue, look worse, and undermine your progress

Step 4: Eat Bodyweight (lbs) × 10 Calories Per Day 0:41

- Formula: take your bodyweight in pounds and multiply by 10 — that is your daily calorie ceiling
- Example given directly by Brandon:
 - His weight ≈ **200 lbs** → daily intake = **2,000 calories**, not one calorie more
- This creates a controlled deficit calibrated to the individual's size

Step 5: Eat 1 Gram of Protein Per Pound of Bodyweight 0:52

- Consume **1 g of protein for every pound of bodyweight** each day
- Brandon pre-empts the common objection:
 - Question: "What if someone weighs 300 lbs — do they eat 300 g of protein?"
 - Answer: "Yes, exactly that."
- The science behind the high protein target — **Thermic Effect of Food (TEF)**:
 - Every time you eat, your body burns calories to digest the food
 - Protein requires **more calories to digest than any other macronutrient**
 - Roughly **2× the thermic cost of carbohydrates**
 - Roughly **3× the thermic cost of fat**
 - High protein intake therefore burns additional calories through digestion alone, beyond its muscle-preservation benefits

Bonus: Personal Diet & Workout Plan 1:02

- Brandon offers a personalized diet and workout plan directly to viewers
 - To receive it: comment the word **"roadmap"** on the video
 - He states he will send it directly to those who comment
