Tim's Background and Why AI Changes Everything 0:00

- Tim owns several digital product businesses with **over \$50 million in lifetime sales** and now runs them with far fewer people than before
- His first digital product business took **6 months** to launch from scratch
 - He had zero business skills at the start: didn't know what a sales call was, how to build a curriculum, or how to write an ad or VSL
 - Had to buy courses, read books, watch YouTube videos, and piece everything together manually
- His claim: with AI available today, the same business could be launched in **under 30 days**
 - AI compresses the learning curve — e.g., instead of reading 3 sales books, run your sales call transcript through AI for immediate feedback
 - AI acts as a second pair of eyes on ads before launch (previously he had no way to know if an ad was good until he spent money testing it)
 - An 8-week course curriculum that took 8 weeks to build can now be done in **1 week** with AI assistance

- The product he built: a **trading and investing digital product** with his father as the face
 - Tim was 21 years old; his dad had **20 years of market experience** — more credibility
 - Tim built all the educational materials and curriculum behind the scenes; his dad was the expert and face of the brand

You Don't Need to Be the Expert (Or the Face) [1:34](#)

- Two valid paths for starting a digital product business:
 - **Path 1:** You have a monetizable skill and want to be the face — build and sell your own product
 - **Path 2:** You have no unique skill set or don't want to be on camera — find someone else who is the expert and run everything behind the scenes for them
- Real client example from Tim's B2B advisory company:
 - Client had no knowledge of luxury home building
 - Found a luxury home builder locally in **Dallas** who needed help running his business and building digital products
 - Client made the home builder the expert and face; client ran all operations behind the scenes
- Key insight:
