

The best fat loss rules for men over 30!

Channel: Brandon Carter · Published: Aug 13, 2026 · Watch: https://www.youtube.com/shorts/DctlvP0_yvI Source: full transcript

Executive Summary

Brandon Carter outlines six practical, no-fluff fat loss rules specifically for men over 30, spanning daily step targets, nutrition tracking, protein goals, beverage choices, workout structure, and sleep.

Contents

-  Rule 1: Walk 20,000 Steps Per Day
-  Rule 2: Track Your Calories and Macros
-  Rule 3: Eat 1 Gram of Protein Per Pound of Body Weight
-  Rule 4: Stop Drinking Your Calories
-  Rule 5: Train Full Body Workouts Four Times a Week
-  Rule 6: Sleep At Least 7 Hours

Rule 1: Walk 20,000 Steps Per Day 0:05

- Target: **20,000 steps daily**
 - A high daily step count increases non-exercise activity thermogenesis (NEAT), burning additional calories without structured exercise

Rule 2: Track Your Calories and Macros 0:08

- Actively monitor both total calorie intake and macronutrient breakdown
 - Tracking creates awareness and accountability, which are key drivers of dietary adherence and fat loss progress

Rule 3: Eat 1 Gram of Protein Per Pound of Body Weight 0:11

- Protein target: **1 gram per pound of body weight**
 - Adequate protein preserves lean muscle mass during a calorie deficit, which is especially important for men over 30 as muscle mass naturally declines with age

Rule 4: Stop Drinking Your Calories 0:14

- Eliminate liquid calorie sources (sodas, juices, alcohol, specialty coffee drinks, etc.)

- Liquid calories are easy to overconsume and do not provide the satiety that solid food does, making fat loss significantly harder

Rule 5: Train Full Body Workouts Four Times a Week [0:17](#)

- Workout structure: **full body sessions, 4x per week**
 - Full body training maximizes muscle stimulus frequency and calorie burn across the week compared to traditional split routines

Rule 6: Sleep At Least 7 Hours [0:21](#)

- Minimum sleep target: **7 hours per night**
 - Insufficient sleep negatively impacts hormone levels (cortisol, testosterone, insulin), appetite regulation, and recovery — all of which directly undermine fat loss efforts in men over 30
