The Hamstring Struggle & the Switch to Dumbbell RDLs 0:00

- Creator admits he "struggled massively with hamstrings" for a long time
 - Describes his legs as "strings of ham" — implying very little muscle development
- Decided to try something different: **dumbbell RDLs** (Romanian Deadlifts)
 - Previous approach wasn't delivering the targeted feel he needed
- Key technique detail — leaning against a surface while performing the movement:
 - Eliminates the risk of falling forward
 - Removes the need to balance or stabilise, so all focus goes to the hamstrings
 - Allows a slight knee bend throughout the movement
 - Produces a "specific pull" directly felt in the hamstrings
- The main benefit: ability to isolate and "target them so easily" compared to other variations

Visible Results & Unexpected Pull-Up Discovery 0:22

- Also mentions doing pull-ups recently as part of training
 - Initially had no idea pull-ups were contributing much to hamstring/posterior development
 - Could feel some aching in the mornings but dismissed it as minor
- A photo taken confirmed significant visible results:
 - The hamstring development is described as looking like "a second ass" — a striking visual indicator of rear-leg muscle mass

"It looks like a second ass." — the creator's own measure of how dramatic the hamstring gains became.

- Takeaway: combining **dumbbell RDLs** (with surface support) and pull-ups produced noticeable posterior-chain growth that a photo made undeniable
