I Edit My Videos By Talking (Part 2)

Channel: Brandon Carter · Published: Oct 24, 2026 · Watch: https://www.youtube.com/shorts/tY7Z-0divKI Source: full transcript

📋 Executive Summary

Brandon Carter shows how he uses Claude AI to edit videos entirely via spoken commands — rotating content, adding B-roll, changing styles and music — without manually touching an editing timeline.

📑 Contents

- 🎙️ The Core Claim: AI-Powered Editing by Voice
- 🗣️ Live Demo: Commands Given in Order
- 🎬 Production Style Transformations

🎙️ The Core Claim: AI-Powered Editing by Voice 0:00

- Brandon states flatly: "I don't edit my videos anymore. I just let Claude do it for me."
  - This is framed as a complete replacement of manual editing, not just an assist
  - Claude is the AI tool being used to interpret and execute spoken editing instructions

🗣️ Live Demo: Commands Given in Order 0:00

- The demo proceeds as a rapid sequence of natural-language voice commands:
  - "Make my top performing videos rotate around" — dynamically arranges his best content in a rotating layout
  - "Now move one of them over here" — repositions a specific video element on screen
  - "Now show what my students are making" — pulls in student-generated content
  - "Now zoom in" — applies a zoom effect
  - "Whoa, too much" — the AI responds to real-time feedback and dials back the zoom
    - Notable: correction is conversational, not a precise technical instruction
  - "Now add B-roll" — inserts supplemental footage automatically
  - "Now change the music" — swaps the background track
  - "Change it again" — iterates on the music selection with another single command

🎬 Production Style Transformations 0:00

- One command stands out for ambition: "Make it look like a Vox documentary"

    - Vox is known for a distinct high-production style: motion graphics, data visualization, clean typography, and editorial pacing
    - The implication is Claude can interpret a *vibe or reference* and apply a matching aesthetic — not just mechanical edits
- Followed immediately by: "Make it look like a high production YouTube video"
    - Shows the system can shift between named style references on demand

> The most striking moment is the zoom correction — "Whoa, too much" — suggesting the AI understands informal, reactive feedback mid-edit, not just pre-planned instructions.
