# Who AI Is Going to Replace First

Channel: Tim Luong · Published: Oct 18, 2026 · Watch: https://www.youtube.com/shorts/U6hZ-WIL-EM Source: full transcript

## 📋 Executive Summary

If your job consists only of executing orders and waiting for instructions, AI will replace you first. The skills that matter going forward are judgment, prioritization, and the ability to critically evaluate AI outputs.

## 📑 Contents

- ⚠️ The Jobs AI Will Replace First
- 🧠 Why Judgment and Prioritization Are the New Value
- ✅ What You Should Do Now

## ⚠️ The Jobs AI Will Replace First 0:00

- If your job is limited to executing commands and following instructions, "you are in trouble"
  - AI is becoming smarter every day with continued use
  - Roles where a person simply waits for directions and a task list to complete their work are the most vulnerable
  - Soon it will be possible to program AI agents with precise instructions to complete those same tasks faster, more efficiently, and around the clock (24/7)

## 🧠 Why Judgment and Prioritization Are the New Value 0:22

- The skills that are becoming increasingly valuable are those AI cannot easily replicate:
  - **Discernment and judgment** — knowing what is right vs. wrong independent of AI bias
  - Knowing how to prioritize tasks without being told
  - Understanding AI outputs well enough to identify errors and correct for the model's inherent biases
- Any role that depends on waiting for guidance to get work done will be targeted first by AI automation

## ✅ What You Should Do Now 0:43

- Actively develop the following capabilities:
  - Learning how to set your own priorities without external direction
  - Sharpening your ability to discern and discriminate between good and bad outputs
  - Cultivating refined taste and sound judgment
- Do not rely solely on AI to provide all the answers — critical human evaluation remains essential

> The key insight: AI will first replace those who wait to be told what to do. The humans who remain irreplaceable are those who can judge, prioritize, and think beyond the machine's output.
