

Strength +5 Hand Size +10 Life Hack

Channel: Onem · Published: Jun 30, 2026 · Watch: <https://www.youtube.com/shorts/91CJKZiu9o4> Source: full transcript

Executive Summary

A short tip arguing that building grip strength is an underrated gym hack — stronger hands lock weight in place, prevent energy leakage at the wrist, and can add roughly 5 kg to every lift.

Contents

-  The Grip Strength Hack
-  The Fishing Net Analogy
-  Why Weak Grip Kills Your Lifts
-  The Payoff: ~5 kg Added to Every Lift

The Grip Strength Hack [0:00](#)

- Presenter calls grip training a "very unknown gym life hack" that most people overlook
- Demonstrates using a grip trainer set to **100 kg**
- Claims consistent grip training produces visibly thick, dense hands

The Fishing Net Analogy [0:23](#)

- Compares a weak grip to grabbing a fishing net from a distance
 - If you grab the net far from the fish, the net is loose and floppy — the fish can slip or the net can snap
 - If you grab the fish directly at the throat, you have full control and leverage
- The same principle applies to your hands on a bar or implement
 - Flimsy wrists = loose connection = lost leverage
 - Strong grip = tight connection = full leverage transferred into the movement

Why Weak Grip Kills Your Lifts [0:45](#)

- When grip is solid, the weight effectively becomes an extension of your body
 - "That weight feels as though it's part of your hand. It feels like it's part of your body."
- A common failure pattern: grip gives out before the target muscle is exhausted
 - Example: shoulders still have reps left, still feel strong, but the hands fail first
 - This means the working muscle "still had weight to go" — you cut the set short artificially
- Energy is wasted stabilising a loose grip instead of driving the lift

- A firm grip means no wasted energy; everything stays locked in place

The Payoff: ~5 kg Added to Every Lift 1:08

- Once grip strength is developed, movements become "exceptionally easy" because the weight isn't going anywhere
- Estimated carry-over: **~5 kg added to every single lift** across all exercises
- Described as "an absolute game-changer" for overall strength performance
