

# Why most people quit too soon

Channel: Brandon Carter · Published: Aug 03, 2026 · Watch: [https://www.youtube.com/shorts/j6LXDTP-k\\_g](https://www.youtube.com/shorts/j6LXDTP-k_g) Source: full transcript

## Executive Summary

---

Consistency fails because people expect linear progress, but results follow an exponential curve. The early flat period — the "quit zone" — is where most give up, just before the explosive growth phase begins.

## Contents

---

-  The Linear vs. Exponential Results Trap
-  The Quit Zone
-  What Happens If You Persevere

## The Linear vs. Exponential Results Trap 0:00

---

- The core reason people struggle with consistency is a **mismatch in expectations**
  - Most people assume results will come in steadily — a straight, linear line upward
  - In reality, results almost never follow a linear curve
- Progress is typically **exponential**
  - Very little visible progress happens in the early stages
  - Then, after that slow period, there is a sudden explosion of results

## The Quit Zone 0:10

---

- Because people expect linear growth, the early flat period feels like failure
  - Frustration builds when effort doesn't seem to produce visible results
  - This is the point where most people quit or give up
- This early flat stretch is specifically called the **"quitting zone"**
  - It's a predictable, identifiable phase — not a sign that something is wrong
  - The danger is that it feels indistinguishable from genuine failure

## What Happens If You Persevere 0:22

---

- Pushing through the quit zone leads to the exponential explosion of results
  - The outcome on the other side is described as *even better than what you originally expected*
- The single actionable takeaway: **make it out of the quit zone**

- Recognize the slow early phase as a normal, temporary part of the process
- Persevere through it rather than interpreting the lack of results as a reason to stop

The key is to make it out the quit zone and be able to persevere through that.
