

# Why I Quit Drinking 11 Years Ago, and Why You Should Too!

Channel: Brandon Carter · Published: Jul 07, 2026 · Watch: <https://www.youtube.com/shorts/Jd2IWZ2FLD0> Source: full transcript

## Executive Summary

Brandon Carter illustrates why alcohol causes weight gain by comparing popular drinks to equivalent whole-food meals, arguing these "empty" liquid calories add up to full meals every time you go out.

## Contents

-  Alcohol Calorie Comparisons
-  The Takeaway: Why Carter Quit Drinking

## Alcohol Calorie Comparisons 0:00

- Core argument: drinking your calories is a hidden but major cause of weight gain
- Each popular alcoholic drink is shown to be calorie-equivalent to a substantial whole-food meal:

| Alcoholic Drink | Food Equivalent                             |
|-----------------|---------------------------------------------|
| 2 beers         | 6 oz chicken breast                         |
| 1 margarita     | 4 oz sirloin steak + asparagus + side salad |
| 3 rum & Cokes   | Turkey sandwich + side salad                |
| 1 piña colada   | 5 oz salmon + steamed rice + green beans    |
| 3 tequila shots | 4 oz sirloin steak + side salad             |

- The implication: every typical night out involves consuming the caloric equivalent of one or more full meals — on top of whatever food you eat

## The Takeaway: Why Carter Quit Drinking 0:22

- Direct callout: "This is one of the reasons y'all getting fat"
  - People are unknowingly eating the equivalent of a full meal in liquid form every time they drink socially
- Brandon Carter states he personally quit drinking alcohol **11 years ago**
  - No further elaboration given in this clip beyond the calorie-equivalence argument as the motivating logic
