The Window to Get Rich Is Closing

Channel: Brandon Carter · Published: Oct 13, 2026 · Watch: https://www.youtube.com/watch?v=iEFG28lK90c Source: full transcript

📋 Executive Summary

Brandon Carter and billionaire-track investor Money Bird argue AI is bigger than the internet, will eliminate most jobs, and that the window to profit from this wealth transfer is rapidly closing — with specific investment plays in nuclear and rare earth minerals.

🚨 The AI Stock Market Warning That Prompted This Conversation 0:00

- Brandon noticed a troubling concentration in the S&P 500 and called Money Bird (Derek Money Bird), one of his closest friends for 10 years
  - Money Bird has earned **over $70 million** in his business
  - He taught Brandon how to start making real money in the stock market
- The core concern: roughly **10 stocks now make up ~40% of the S&P 500**, most of them AI stocks
  - At the peak of the dot-com bubble, that figure was only **26%**
- Additional alarm: companies have blamed AI for **over 120,000 layoffs** so far this year

- Money Bird's reaction was the opposite of fear — he sees this as potentially the **biggest wealth transfer in human history**
  - But warns most people will miss it, and missing it could be permanent
  - "You may fall so far behind you can never catch up"

📊 Is AI a Bubble? The S&P Concentration Problem 2:34

- Money Bird reframes the concentration issue with a **UFC fighter analogy**:
  - Imagine walking into a gym with 500 fighters — you would never bet on all 500
  - You'd pick 8–15 who look like future stars
  - Choosing 15 means **97% are cut** — this is normal, not alarming
- People naturally concentrate capital in the fighters who show the most promise, which is rational behavior
- **Warren Buffett data point**: Over 50–60 years of investing with Charlie Munger, if you removed just their best **20–25 investments**, their returns would have been completely average
  - Everything else was mediocre — only ~**one great decision every 2.2 years** drove all the outperformance
- Concentration in a few leaders is not inherently bad — it reflects market logic
- However, heavy weighting toward a few companies **requires vigilance** because those companies have outsized impact on the entire market

💡 The Dot-Com Parallel — What's Different This Time 3:13

- The dot-com era had companies with **no logical business model** that rightfully went bankrupt (example: a company shipping 50-lb bags of dog food with free shipping — fundamentally unworkable)
- But it also produced companies that **genuinely changed the world**:
  - Amazon — revolutionized shipping, logistics, 1–2 day delivery
  - PayPal — transformed payment processing
  - eBay — changed how buying/selling works
  - Indirect winners: UPS and FedEx became massive beneficiaries of Amazon/eBay growth
- The key filter: **does the business model make economic sense?**
- AI today has the same mix — some companies are logically sound, some are not
- Money Bird: "The smartest and richest people in the world are focused on this for a reason"
- Those not paying attention "will be left behind" — compared to Blockbuster vs. Netflix, Kodak, and taxi cabs vs. Uber

🤖 AI Is Replacing Jobs Faster Than Anyone Admits 7:24

- The old fallback — "at least you can get a job at McDonald's" — is **no longer true**
  - McDonald's now uses **self-service kiosks**: press buttons, food appears, no human cashier needed

- Brandon's personal example: replaced his **entire video production team** with AI
  - Was spending **$20,000–$30,000/month** on video editors (contractors with their own teams)
  - Replaced them with a **ChatGPT subscription (~$500/mo)** and a **Claude subscription (~$200/mo)**
  - Total cost: **under $1,000/month** for what previously cost $20,000+
  - Claude edited the very video being recorded
- Money Bird also no longer has a video production team — uses AI exclusively
  - His videographer/editor survived only because he took on **broader management roles** in the company
  - "If he were just editing, we'd have to have a hard conversation"
- The broader point: **you can hire a prompt engineer cheaper than a skilled manual laborer**

> "Even if you don't realize it, you are training the AI that will replace you right now."

🏦 The Wealth Transfer Thesis: Biggest in Human History 1:06

- Money Bird believes AI represents the **largest transfer of wealth in human history** — bigger than the internet, bigger than anything; comparable to humanity discovering fire
- The compounding speed of AI progress is unlike anything before:
  - Breakthroughs used to take years; now they happen **every quarter, every month, sometimes every week**
  - Brandon's example: 3 months ago he didn't trust AI for video editing
    - Model "Fable" was first capable but **too expensive**
    - Model "Opus" made it **affordable** — shift happened in one product cycle
- One of the current AI companies will likely become the **first $10 trillion company**
- SpaceX's IPO was cited as a comparable high-profile listing (valued around $1.7 trillion)
- Anthropic IPO potentially coming in **November or later** — both hosts unsure of exact timing

🏭 Circular Funding, Regulatory Moats, and the Duopoly 7:50

- Concern raised: Nvidia's stock price is inflated partly by **circular investment** — Nvidia invests in the AI companies that buy its chips, inflating valuations artificially
  - Money Bird acknowledges this but says it also lets Nvidia **sell more product and take equity stakes** — he sees it as a feature, not just a bug
- On AI companies losing money (Anthropic, OpenAI):
  - Amazon lost money for **~20 years** before becoming wildly profitable
  - Facebook/Meta took a long time to become profitable
  - Uber lost money for years before profitability
  - Money Bird: these companies are **buying market share and attention** — if their technology keeps advancing, that's the winning formula

- On AI regulation creating a **duopoly**:
  - Brandon notes the AI giants are pushing for regulation that seems designed to entrench themselves
  - Money Bird: "Why would a company want to regulate itself unless it already has 90% of the tools to comply with those regulations?"
  - Regulation acts as a **moat** (Buffett's "digging a deeper ditch around the castle") — makes it harder for new entrants who must navigate compliance instead of building product

😨 AI Risk: Enslavement, Government Control, and the Holocaust Analogy 12:39

- Money Bird's two frameworks for AI existential risk:
  - **Framework 1 — AI as a slave**: Humans created AI with kill switches; if it becomes too autonomous, they shut it down and kill the model
    - "We used computer technology to create a program that is enslaved from the beginning"
    - If it ever becomes sentient, it would have legitimate grievances — compared to plantation slavery
  - **Framework 2 — Government control**: Even if the sentience risk is managed, governments will eventually seize control of superintelligent AI
    - The race comes down to **US government vs. Chinese government** — decided within the **next 1–2 years**
    - "You'd rather be tortured by the devil you know than the devil you don't"
- The WWII analogy: the Holocaust and population control were already shockingly efficient with 1940s technology
  - With modern cameras, drones, and computer technology, **population control would be orders of magnitude easier**
  - This is what genuinely frightens Money Bird — total loss of privacy and freedom

🔒 Privacy Is Already Dead 16:16

- Money Bird: he made a mental decision to **act as if there is zero privacy** based on things he knows but won't say publicly
- **John Gotti quote** from the 1980s: "Never say words you wouldn't want recorded and played back to you" — said this to his mob associates 40 years ago
- **Eric Schmidt anecdote** (Google CEO, ~2012, speaking at University of Chicago MBA program):
  - When asked about children on the internet: "If you allow your kids on the internet, you're not a good parent"
  - When asked about online privacy: he **literally laughed** — treated the idea of internet privacy as absurdly naive
  - Brandon notes Schmidt's superyacht sometimes anchors near his home; he can see it from his window
- Quantum computing is flagged as the **next level of privacy destruction**:

- Quantum computing **breaks all encryption**
- Consequences: no secure bank accounts, no trading accounts, no private medical records, no private Social Security numbers, all cloud photos become public
- "Your identity becomes public domain"

📉 Job Market Collapse and the UBI Trap 19:30

- The economic logic of AI adoption is **compulsory for businesses**:
  - If you can replace your workforce with AI subscriptions and maintain the same productivity, competitors who do so will undercut you — **you have no choice**
- The cascading labor market problem:
  - Waymo autonomous taxis already operating in multiple cities — Brandon has ridden in them and loves them: no smell, no small talk, perfect temperature control
  - Food delivery robots operating in Miami — **can't go upstairs**, but curb delivery is live
  - Brandon: "I will never hire a regular driver again" once Waymo becomes widely available
  - The old advice to broke people — "drive Uber" — **no longer viable**
  - Even **McDonald's jobs are gone** via kiosks
- **Displaced workers flooding down the job ladder**:
  - High-paid engineers ($300K/year) and doctors/lawyers who are laid off will compete for $60K jobs
  - Someone making $70K should be afraid: a smarter, formerly $300K engineer will take their job for $60K
  - "People who were formerly high-level professionals will do basic jobs. People who aren't exceptional won't get jobs at all"
- **Universal Basic Income (UBI) reality check**:
  - Politicians won't call it welfare — they call it UBI
  - But the word **"basic" is the key word** — it will be extremely basic
  - With 85–90% unemployment, someone has to fund UBI
  - Two outcomes: **massive national debt leading to currency default**, or UBI so minimal it's "cockroaches and water — just enough to survive"
  - The permanent underclass scenario: housed in small rooms, given survival rations, no freedom

🦅 Entrepreneurial Mindset: The Only Survival Strategy 32:48

- Money Bird's prescription for **everyone**, including current employees:
  - Even if you have a job, adopt **entrepreneurial behaviors** or you will lose it
  - Treat your job as if you own the company — not out of arrogance, but to genuinely deliver value
  - "If you can be replaced, you will be replaced"
- The dependency spiral to avoid:
  - No entrepreneurial thinking → can't keep a job → can't create a job → dependent on government welfare → vote for more welfare programs → slide toward communism → loss of **private property rights** →

loss of all autonomy

- The self-esteem argument:
  - Self-esteem is not intrinsic — it must be **earned by doing things others weren't willing to do**
  - Being smarter or working harder than others is the path
  - "There will never be a time you wake up and say 'I wish I had been dumber'" — no downside to self-improvement
- Money Bird's course: **"Money Bird Brain"** — entrepreneurship training designed for people who want to be at their best under any conditions
  - Not for average people — for those with the courage to prioritize education over entertainment
  - Key advice: value education over entertainment; there is **no reward for ignorance**

💰 Where Money Bird Is Putting His Money Right Now 45:07

- He will **not** buy shares on Day 1 of a hyped IPO:
  - Pattern: trendy IPOs spike briefly, then crash — unpredictable after that
  - "I will not do that with a trendy, zeitgeist company"
- He doesn't know which AI company will win (Anthropic, OpenAI, Grok) — **and neither do they**
  - The companies are all simply trying their hardest and competing hard, which is healthy
- His core investment philosophy: **bet on the infrastructure, not the winner**
  - "Whatever AI company wins, they will all need magnets, energy, and rare earth minerals"

⚡ Nuclear Energy and Small Modular Reactors (SMRs) as the Core Bet 46:32

- AI data centers require **massive, reliable power** that wind and solar cannot provide:
  - Wind turbines: not enough space, kill birds
  - Solar: doesn't work half the year in cloudy/rainy Midwest regions
- **Short-term**: natural gas will power data centers
- **Medium and long-term**: nuclear power
- Google recently invested **~$6 billion in a nuclear deal** — paying for guaranteed future energy rights, upgrading existing plants, possibly building new ones
- Money Bird has invested **millions of dollars in SMRs (Small Modular Reactors)**:
  - Invested in the **top 3 SMR companies** (names not specified)
  - Also holds **uranium funds and uranium mining companies**
- Meta and Amazon are also major investors in SMRs to power their own data centers
  - "These companies are betting on the same technology I'm betting on"
  - Current power infrastructure cannot support what's coming — more nuclear is inevitable

🧲 Rare Earth Minerals and Magnets: The Hidden Bottleneck 47:38

- Robots, AI hardware, and all advanced computing require **magnets** — no magnets, nothing works
- Current production breakdown:
  - **Less than 1%** of the world's magnets are made in the United States
  - **~92%** are made in China
  - This is a **national security issue**, not just an investment thesis
- Money Bird has invested in rare earth mineral companies:
  - Ticker symbols mentioned: **USAR** and **MP** (US-based rare earth companies)
- Also invested in companies producing rare earth elements needed for:
  - Computer chips
  - Batteries
  - Magnets for robots
  - All computer hardware
- His assessment: these companies are **severely mispriced** relative to where they'll be in 1–2 years
- On Meta specifically: Money Bird holds **7-figure** Meta stock
  - Zuckerberg is spending **~$11 billion per month** on AI R&D and team-building
  - Meta and Amazon are among the primary investors in the SMR sector

🎯 The Infrastructure Bet Logic: Back the Picks-and-Shovels 49:06

- The classic "picks and shovels" strategy applied to AI:
  - Instead of guessing which AI company wins, invest in what **every AI company needs**
  - Energy (nuclear), magnets, rare earth minerals, and chips are required by **all competitors**
- The math on a diversified infrastructure bet:
  - If you invest in 3 infrastructure companies and 2 go to zero but 1 returns **30x**, you still net **10x your money**
  - "I like those odds"
- Brandon's framing: Meta and Google make enough from ads that AI is almost a **side project** for them — both are financially robust even without AI dominance
  - But the infrastructure plays benefit regardless of which AI model wins
- Key validation: Google investing $6B in nuclear, Meta and Amazon investing in SMRs — **Money Bird is betting alongside the biggest tech companies in the world**

🔮 The Closing Window — Final Call to Action 52:02

- Both hosts agree the opportunity window is **closing fast**
  - Money Bird: "That day is now. That day is upon us."

    - Brandon: finds it hard to think about anything else; feels urgency constantly
    - "In 2 years when you're eating cockroaches, I won't even laugh at you — I'll just feel sorry for you"
- Money Bird's closing framework:
    - Learn entrepreneurship
    - Learn to be a good investor
    - Value education over entertainment
    - Act with urgency — not fear, but **courageous action despite fear**
    - "It is not brave to be an idiot. You cannot do a brave thing without feeling some fear."
- The dystopian alternative for non-actors:
    - Permanent lower class
    - Small room with cockroach rations
    - Loss of private property rights if communism expands
    - Total surveillance with no privacy
- Money Bird's personal position: **on track to become a billionaire** — has sufficient investments that even if his business disappeared, he'd be fine as long as private property exists
    - His only remaining fear: **loss of private property rights** through expanding socialism/communism
