Gemini Argon Just Dropped. Can It Make Money?

Channel: Brandon Carter · Published: Oct 14, 2026 · Watch: https://www.youtube.com/watch?v=LhI6DleF0NM Source: full transcript

📋 Executive Summary

Brandon Carter stress-tests Gemini's new Argon model exclusively for economic value — building business dashboards, stock tools, and media — and finds it capable but unimpressive versus Claude/GPT, mainly due to weak UI output.

🧠 Who Brandon Is & His Testing Philosophy 0:23

- Brandon's core question every time a new AI model drops: **"How can I weaponize this against poverty?"**
  - Explicitly rejects "wacky" or cool-but-useless demos other AI YouTubers do
  - Only cares about economic value — what makes money as fast as possible
- Credentials he uses to justify his evaluation lens:
  - Helped ~15,000 people grow successful online fitness businesses using AI over 10 years
  - Runs several multi-figure businesses and one eight-figure business
  - 100% of his YouTube videos have been AI-edited since GPT-6 launched
    - Tools used: GPT-6 in Codex, the Astra model, Soul model, or Claude Code with Opus 5.5
- All prompts in this video are one-shot, off-the-top-of-his-head — he explicitly notes he stopped formal prompt engineering once models got good enough

📊 Argon Benchmark Overview 1:38

- Data source: Artificial Analysis benchmarks
- **Intelligence ranking:** Argon ties with GPT-6 Astra and Claude Fable 5.1
  - Slightly behind Opus 5.5
  - Smarter than the new Meta Muse Wonder model (dropped the day before)
  - Slightly smarter than Soul
- Cost advantage is the headline story:
  - Cost per task is significantly cheaper than Astra
  - Cheaper than Grok
  - Cheaper than Meta Muse
  - Anthropic models (Claude line) remain the most expensive across the board
- Context: Gemini had previously been Brandon's favorite LLM before falling behind frontier models — Argon signals their return
- Access: Requires a paid Gemini plan; usable in desktop app, web app, or mobile
  - "Gemini Task" is their agentic platform (comparable to Claude Co-work)
  - Full coding/agentic use requires "Anti-gravity" (their version of Claude Code/Codex) — reportedly on the $200/month plan

💡 Task 1: Personalized Money-Making Ideas from Meeting Notes 2:37

- Prompt given: "Give me projects where I can make money fast. Use everything you know about me, my following, my background. Budget under $1,000. Return within two weeks."
- Key advantage here: Google had access to his data via connectors
  - Meeting notes with staff, clients, coaching customers already synced
  - Argon read through all of it to personalize recommendations
- Top 5 ideas it surfaced (all grounded in actual meeting data):
  - **30-Day Content Sprint** — based on a new ad strategy Brandon was already working on; included show rate and setter optimization; Argon auto-built a content tracker and filled in existing data unprompted
  - **Live AI Content Engine Implementation Intensive** — a paid workshop ($1,200–$2,000) teaching coaches/creators/gym agents/agencies how to edit videos with Claude or ChatGPT; Argon spotted that coaching clients had been asking for this; projected revenue if 25 seats sold
  - **Corporate B2B Intelligence Sprint** — sell/license a "competitor espionage dashboard" to corporate clients; based on 1-on-1 clients asking about his existing "Espionage OS" tool
    - Espionage OS: a custom-coded tool Brandon built that pulls competitor ads from Meta Ads Manager, shows how long each ad has been running (longer run = likely more successful), displays captions, headlines, and full transcripts, and lets you watch the ad inline
    - Argon identified this as teachable/sellable to others
  - Additional ideas generated but not detailed on screen

- Brandon's honest take: "Any platform could have done that. Claude Co-work, ChatGPT, Grok, Muse — all have the same functionality." Nothing yet that made him feel Argon was uniquely valuable.

🏋️ Task 2: Client Check-In Dashboard for Online Trainers 5:33

- Use case: Online fitness coaches do weekly check-ins with clients — this automates and organizes that workflow
- **One prompt only**; tool named "Check-In HQ"
- Features Argon built:
  - Shareable link coaches can send clients to fill out a check-in form
  - Dashboard showing: active client count, average adherence rate, clients at risk (missing check-ins), who needs immediate attention
  - Individual client drill-down view:
    - Weight on scale over time
    - Adherence tracking (daily task completion)
    - Body composition data
    - AI-generated feedback the coach can copy-paste (multiple variations)
    - Week-over-week progress history
  - Draft reply feature: once client data comes in, it auto-drafts a coach response
- Brandon's reaction: "I would have killed for something like this when I first started online training in 2009."

📈 Task 3: Stock Analysis Tool with Legendary Investor Frameworks 4:40

- Prompt: Enter any ticker symbol → get fair value, current market price, and analysis of whether 5 legendary investors would buy it based on their actual strategies
- Tested with Nvidia (NVDA):

Investor	Decision	Reasoning
Warren Buffett	Would Buy	DCF intrinsic value supports it
Peter Lynch	Would Buy	Fast grower matching his strategy (ref: *One Up on Wall Street*)
Benjamin Graham	Watch List / No Buy	Trailing PE ratio and other fundamentals don't qualify
Joel Greenblatt	Watch List / Uncertain	Partial fit with his strategy
Cathie Wood	Would Buy	(Brandon jokes this might be a reason to *avoid* it)

- Additional features generated in one prompt:
  - Real-time price action chart (viewable by: 5 years, 1 year, 6 months, 1 month, 5 days, today)
  - Volume chart
  - Wall Street consensus analysis panel

    - Latest news headlines (clickable)
- Caveat: "The UI is pretty ugly, I'm going to be honest with you."
- Note: Brandon had done something similar with Codex + ChatGPT previously and wished he'd given both the same prompt to compare directly

💰 Task 4: Habit-to-Revenue Tracker 6:24

- Concept: Track daily habits and see how they correlate to revenue
- Short, casual prompt — no detailed spec given
- What Argon built:
    - Task tracking where each task is tagged with estimated revenue impact
    - Intrinsic habit tracking: worked out? posted content? diet quality? hours slept?
    - Sales call tracking
- Brandon's note: UI again needed work; he acknowledged he could likely fix it with more prompt iteration

📋 Task 5: Sales Pipeline Dashboard 6:48

- One prompt; Argon built this in the Gemini app canvas (it chose canvas format unprompted)
- Features:
    - Lead list with notes/context on each lead
    - Full customer journey tracking: New Lead → Booked Call → Showed/No-Show → Closed/Lost
    - Auto-drafted follow-up texts, DMs, or emails for each lead
    - Follow-up due dates with last-contact timestamps
    - Pipeline value: input lead worth → see total money in pipeline
    - Auto-calculated show rate and close rate
    - Confetti animation on wins (not requested — Argon added it)
- "That little confetti — I ain't tell it to do that."
- Leads that are lost or no-show automatically route to a follow-up list

📞 Task 6: Sales Call Grader (Failed) 7:17

- Concept: Paste in client info + call transcript → get a grade on the sales call
- Result: Brandon found the UI so visually unappealing he refused to even review the output on camera
- "It's too ugly to look at. That's a fail."
- This was the turning point where he stated plainly: "I'm not that impressed with Argon."

🎵 Task 7: AI-Generated Music 7:46

- Argon can generate music — a capability many other AI tools won't do

- Prompt: hip-hop trap, dark R&B, with vocals about "balling, making money, flexing on haters" (brain-dump style prompt)
- Output: Generated quickly; Brandon played it on camera
  - Verdict: "Better than I thought it would be, but still not good enough not to call it slop."
- Practical use case Brandon identifies:
  - Royalty-free music for social media to avoid copyright strikes
  - Background music for ads
  - Quick instrumentals in any genre (he also tried Afrobeats instrumental)
- He opened a second chat while waiting for the Afrobeats version, so no final verdict on that one shared

🖼️ Task 8: YouTube Thumbnail Generation 8:60

- Setup: Brandon had uploaded his avatar/photo to Gemini
- Prompt: Use my avatar, make a YouTube thumbnail for a video about the new Gemini Argon model
- First result: Initially generated a random white man instead of Brandon
  - After flagging it, Argon corrected and used his actual image
  - Result: Too colorful, too many words, rainbow Gemini logo — "looks like I'm making a video about kid stuff"
- Iteration 1 feedback: More serious/moody tone, fewer words, keep Gemini logo but drop rainbow colors
  - Result: Brandon said he looked "homeless"
- Iteration 2 feedback: Don't look homeless
  - Result: Added a beard; Brandon: "I think I'm all right... I'm sure you can use this for something if I spend more time with it."
- Overall: Not production-ready with one-shot prompting

🏁 Final Verdict & Honest Take 9:52

- Brandon's bottom line: **Not impressed with Argon**, at least for his use cases
  - One-shot functional tools work, but UI quality consistently falls short of what he builds with Astra or Opus
  - "If you give the same prompts to Opus, man, that shit's going to be way better."
- Important caveats he acknowledges:
  - He was "ghetto prompting" — zero effort, all off the top of his head
  - Argon may be optimized for use inside Anti-gravity (their $200/month agentic harness), not the standard web chat
  - Different harnesses significantly change how a model behaves (e.g., Opus behaves "way differently" in Hermes vs. Claude Code)
  - He may not have given it fair enough tasks
- Potential future video: Give the exact same prompts to Argon, Astra, and Opus side-by-side to compare

- Closing question to audience: Are you switching to Argon or sticking with Anthropic/OpenAI?
