

You have 90 days left.

Channel: Brandon Carter · Published: Oct 04, 2026 · Watch: <https://www.youtube.com/watch?v=YUg5fXpV8RA> Source: full transcript

Executive Summary

Brandon Carter presents a free, five-step system — goal setting, game planning, structuring with deadlines, calendar blocking, and daily tracking — to cram a year's worth of progress into the final 90 days using Notion, Google Calendar, and AI agents.

-  Adjustments, Plan B, and Staying the Course

Introduction & Brandon's Philosophy 0:00

- Opens by calling out the audience: the year is almost over, most gave up by Valentine's Day
- Claims this video will show how to accomplish more in the next 90 days than most people do in 12 months
- Credentials he states:
 - Built several multi-seven-figure businesses and one 8-figure business
 - Coached tens of thousands of people in fitness and business
 - Helped over **15,000 people** build successful online fitness businesses
- Frames the relationship as coach (himself, "Black Belichick") and student (the viewer, "Tom Brady picked last")
- Core philosophy: don't set goals based on past performance — past performance sucks
 - Instead, plan to cram a year's worth of success into 90 days

- His personal standard: accomplish **four years of victory every 90 days**
- Warning: this approach requires being "way more aggressive, way more ruthless, way more focused" than ever before
 - Explicitly says if you're not willing to do that, this video isn't for you

The Four Weapons & Five-Step Overview [1:55](#)

- Four tools (all free) used to execute the 90-day plan:
 - **Victory Vision Planner** — a free Notion database (link in description) for goal planning
 - **Habit/Success Tracker** — built into the Notion database for recurring tasks
 - **Google Calendar** — for time-blocking every task
 - **AI agents** — free LLMs to help build plans and automate scheduling
- Five-step protocol structure:
 - Step 1 — Set goals
 - Step 2 — Plan the goals (write every step needed)
 - Step 3 — Structure the plan with deadlines
 - Step 4 — Put everything in the calendar
 - Step 5 — Track everything

Step 1: Set Goals Across Four Life Quadrants [4:16](#)

- There are four quadrants of life; pick **one goal per quadrant** (four goals total)
 - **Health & Fitness** — everyone should have one, even elite athletes
 - **Wealth / Income** — argued to be the most important quadrant
 - **Family & Friends** — distinct because it's non-romantic
 - **Romantic Relationships** — treated separately because the dynamic differs fundamentally
- Common mistake: setting too many goals at once — leads to overwhelm and failure (what most people did in January)
- Framework for choosing the right goal per quadrant:
 - Ask: "What's the **one thing** that, if I accomplished it in the next 90 days, would make everything else easier or unnecessary?"
- Example goals used throughout the video:
 - Health: get under **10% body fat**
 - Wealth: start making **\$10K per month**
 - Family: buy mom a new car
 - Romantic: get a (new) girlfriend

Why Wealth Is the Most Important Quadrant [4:38](#)

- "You don't live in the best house available — you live in the best house you can afford."
- Money affects every other quadrant:
 - **Health:** Magic Johnson survived HIV in the '80s because he was a multi-millionaire who could afford the best doctors and medicine
 - **Family:** Georgetown University study — children from wealthy families have better outcomes in all areas of life independent of the child's intelligence; a wealthy average kid outperforms a poor genius on average
 - **Romantic relationships:** #1 cause of divorce is financial issues; divorce rate **plummets after \$200K/year** household income; average couple divorce rate is **50%**
- Conclusion: if you care about your health, family, and relationship, making more money directly improves all of them

Step 2: Build the Game Plan 8:49

- Write out every single step needed to accomplish each goal
- Two types of tasks:
 - **One-time tasks** — done once and never repeated
 - Example (fitness): get a gym membership
 - Example (business): set up an LLC
 - These are typically easy and not the real needle-movers
 - **Recurring tasks** — must be repeated at a set cadence; this is where consistency is hard
 - Example (fitness): track calories and macros every day
 - Example (business): reach out to 100 potential leads every day
- The key mindset shift for planning effort level:
 - Don't ask: "What do I think I can accomplish in 90 days?"
 - Ask instead: **"What amount of effort would I have to put in that would make failure impossible?"**
 - Source of this insight: a guitar teacher told him, "Professionals don't practice till they get it right — professionals practice till they can't get it wrong."
 - Benefits of this framing:
 - Makes it more likely you actually hit the goal
 - Reduces fear of failure — when the plan is airtight, fear diminishes enough to take action
 - "If there's no fear, there's no courage" — the goal is to reduce fear to a manageable level, not eliminate it
- Practical application: be specific, not vague
 - Bad: "I'll do more outreach"
 - Good: "I will reach out to 20 leads today and follow up with everybody"
- If you don't know HOW to accomplish the goal, two options:
 - Read, study, buy courses

- Use a free AI (LLM) to interview you and co-create the plan
- **AI prompt strategy for goal planning:**
 - Open your LLM of choice (he uses Google Gemini for this)
 - Tell it: "I need four game plans. Don't write generic BS. Interview me on each goal one at a time. By the time we're done, you need to know everything about me and my current situation."
 - Critical tip: tell the AI to "ask me each question one at a time" — prevents a wall of generic questions and produces smarter follow-up questions based on your answers
 - Why Gemini specifically:
 - Free version gives extensive usage
 - **Largest context window** of all popular free LLMs — up to **1 million tokens** on the free tier
 - Long conversations cause LLMs to "forget" earlier context and hallucinate; Gemini handles this best
- On mentors vs. AI:
 - Michael Jordan got coach Tim Grover after losing to the Detroit Pistons → **6 championships**
 - Kobe Bryant → Jordan referred him to Grover → **5 championships**
 - Dwyane Wade → Grover → championships
 - Tim Grover wrote the book *Relentless* (tattooed on Brandon's arm)
 - If you can't afford a coach right now, use free AI tools as a substitute

Step 3: Structure the Plan with Deadlines 16:54

- Having a plan without deadlines is a common failure point
 - Setting goals = one step above average
 - Planning every step = next tier
 - **Putting a deadline on every step = what separates winners from losers**
- Tool: **Victory Vision Planner** (free Notion database, link in video description)
 - Two sections: **Ambition Planner** and **Success Tracker**
 - Ambition Planner features:
 - Each column = one goal
 - Each card = one task with a deadline date and optional notes
 - Tasks flow through status columns: Not Started → In Progress → Done
 - Views available: All Goals board, Month view, **Week view** (most useful for daily focus)
 - Goal: get everything to the "Done" column before the week ends
 - If you don't know when a task should be completed, ask AI to estimate
 - Notion also has a built-in AI that can estimate how long each task will take — use it
- Success Tracker (for recurring tasks) pre-built metrics include:
 - Hours worked on goals
 - Income earned

- Hours of sleep
- Whether you worked out
- Macros (carbs, protein, fat) — calories auto-calculate via built-in formulas
- Calories burned (dynamic deficit/surplus calculation)
- Daily weight (with a dynamic graph — if trending down, you're doing it right)
- Daily income (with an uptrend graph — looking for higher highs and higher lows)
- You can add custom properties with the "Add Property" button
- Tools mentioned for tracking:
 - Oura Ring (what Brandon uses instead of Apple Watch for sleep/health data)
 - Apple Watch (good device, just not his preference for daily wear)
 - All device calorie estimates are approximations, not exact — but consistency matters

Step 4: Put Everything in the Calendar [21:25](#)

- Deadlines alone don't work — they tell you *when* something is due, not *when you'll do it*
- You must **time-block** every task in your calendar
- Process:
 - Estimate how long each task will take (use Notion AI if unsure)
 - Open Google Calendar (free; integrates natively with Gemini)
 - Use Gemini to populate the calendar via conversation
- **AI prompt strategy for calendar setup:**
 - Tell Gemini: "Help me plan my calendar. I have recurring tasks I do at the same times every week. I'll give you each task one at a time."
 - Input all fixed obligations first:
 - Work hours (e.g., 9–5 every weekday)
 - Sleep schedule (e.g., 10 PM–6 AM every day — same time every day is the goal)
 - Workouts (daily, color-coded purple)
 - Pre-gym shower + commute buffer
 - Date nights (e.g., Wednesday and Saturday 8–10 PM, color pink)
 - Kids pickup, family time, any other obligations
 - Color-code by category so you can see your week at a glance
 - After obligations are entered, **white space remains** — that's your goal-execution time
 - Then use Notion AI to write a prompt summarizing all your tasks and their time estimates, paste that into Gemini, and have Gemini schedule everything into your remaining white space before each deadline
 - Advanced option: connect your Notion database directly to Claude, ChatGPT, or Gemini and link your Google Calendar — let it handle the scheduling automatically

The Time Math — You Have More Than You Think [25:13](#)

- Total hours in a week: **168**
- Subtract 8 hours of sleep × 7 days = 56 hours → **112 waking hours**
- Subtract a full-time job (40 hours) → **72 hours remaining**
- "That's two full-time jobs worth of time."
- Commuting, errands, grooming don't consume 72 hours — the real issue is unplanned time

"The number one success habit I can give you is to plan every hour of every day in the calendar. If you do that, you will accomplish way more than almost everyone you know."

- Brandon's own schedule: takes 50 flights a year, has 30 employees, attends every school event for his son, takes Disney cruises with him, is a father figure to nieces and nephews whose dad passed — and still gets it all done because everything is calendared

🚫 How a Full Calendar Kills Bad Habits 29:10

- Second major benefit of time-blocking: **accidentally eliminating bad habits**
 - If every hour is accounted for, you won't schedule scrolling, excessive gaming, or other time-wasters
 - You won't "put goofing in the calendar"
- Personal example: Brandon quit smoking and drinking not through willpower or a challenge ("75 Hard is regular to me") but because months passed and he simply noticed he hadn't done it — his calendar was too full
- The antidote to dopamine addiction is not a "dopamine detox" — it's filling your calendar with productive work until there's no room for the bad habit

Step 5: Track Everything 31:21

- "If you are not tracking, you are slacking."
- The Victory Vision Planner becomes your **scoreboard**
 - Leading indicators: hours worked on goals, posts published, leads reached out to, calories hit, calories burned
 - Lagging indicators (the score): income, weight
 - Correlations become visible: more outreach → more income; caloric deficit maintained → weight drops
- From Brandon's 15,000+ students:
 - **100% of students who start making big money fill out the tracking sheet — no exceptions**
 - Students who fail consistently have empty tracking sheets
 - Tracking takes **5 minutes max per day** — there is no valid excuse
 - Once students see the data, it becomes gamified — they naturally optimize
- Key insight: tracking makes performance improvement almost automatic

The Hawthorne Effect — Why Tracking Works [33:41](#)

- Named after researcher Hawthorne, who studied factory productivity during the Industrial Revolution
- Observation: when Hawthorne and his team visited a factory and announced they were watching, **productivity spiked immediately**
 - When they left and stopped watching, productivity returned to the factory's baseline
 - This repeated at every factory they visited
- Conclusion: **people's performance rises when they know they are being observed**
- Application: when you track your own metrics, *you* become the observer
 - Seeing your own progress (or lack thereof) every day causes you to make better decisions
 - "I promise you, if you just start tracking it, that alone will improve your performance."

Using AI & Muse to Automate Tracking [35:53](#)

- Brandon's personal setup (more complex, for reference):
 - CRM: **GoHighLevel** — handles primary tracking
 - **Claude** — counts daily posts, tracks sales team activity
 - Custom daily tracker sheet updated by agents
- Recommended free tool for most people: **Muse**
 - Syncs with: Notion, Google Calendar, GoHighLevel CRM, Instagram, Apple Health
 - Can count how many times you post per day on YouTube, TikTok, Instagram
 - Handles approximately **80% of tracking automatically**
 - Free up to a certain usage limit
 - Example use case: every morning, tell Muse to report on what you accomplished the day before
- How to give an agent a tracking job:
 - "Every morning, check what I did the day before across [platforms] and update my tracker."
 - Muse can pull from Apple Health for sleep and activity data automatically

Adjustments, Plan B, and Staying the Course [37:23](#)

- Calendar estimates will often be wrong — that's normal and expected
- When a task doesn't get done:
 - Do NOT panic or quit
 - Move it to later that day or a different day — **never remove it from the calendar**
 - Use Muse: "I need to focus on YouTube today — move everything that isn't a meeting to open slots on another day"
- Life will interrupt (sick kids, emergencies) — reschedule, don't delete
- Weekly review ritual:

- At end of each week, review what got done and what didn't
- Update deadline dates in both the Ambition Planner and Google Calendar
- Ask the AI: "Why didn't this get accomplished, and how do I prevent that from stopping me again?"
- The cycle: **Plan → Do → Track → Adjust → Repeat**
 - Most people fail here — they see the plan not working and quit instead of adjusting
- On Plan B:
 - A real Plan B is not lowering the goal — it's finding another route to the same destination
 - Analogy: the Allied forces on D-Day probably had a Plan B, but it wasn't "learn to live with the Nazis" — it was another way to defeat Hitler
 - "You can change the route. We never change the goal."
 - The goal may run from you — chase it down anyway
- Closes by directing viewers to additional videos on accomplishing goals
