

# Viking Build Training

Channel: Onem · Published: Aug 27, 2026 · Watch: <https://www.youtube.com/shorts/0voTb0Z8IBQ> Source: full transcript

## Executive Summary

A late-night gym session where the creator shares two core principles for building bigger arms: strict elbow-locked curls for full bicep isolation, and years of natural heavy lifting with clean living.

## Contents

-  Background: Natural Size from Laboring
-  The Elbow Lock Technique
-  Lift Heavy and Stay Natural

## Background: Natural Size from Laboring [0:00](#)

- Creator grew up doing physical labor with his dad — shoveling, wheelbarrowing — which built his base physique
  - Triceps, shoulders, forearms, and back developed naturally and were always large
  - Biceps, however, remained small — the gap he worked to fix
- Sets the scene as a "little night session" with the goal of teaching arm growth

## The Elbow Lock Technique [0:24](#)

- Demonstrates with **22.5 kg dumbbells**, described as a fairly heavy working weight
- The core mistake most people make: swinging the elbow like "throwing uppercuts" or "skiing down a mountain"
  - Momentum takes the load off the bicep and distributes it across the body
- The fix — strict elbow lock:
  - Pin the elbow firmly in place; it does not move at any point during the rep
  - Move only the forearm/hand through the curl
  - Perform in slow motion — controlled, deliberate tempo
  - "If it doesn't move, then it's all bicep"
- Applies the same principle to rope/cable work: lean back, elbow stays still every single rep
- Result: full isolation, no cheating, bigger frame over time

"Lock the elbow. See if we can get the angle. If it doesn't move, then it's all bicep."

## Lift Heavy and Stay Natural 1:40

---

- Second key principle: always train heavy and push to the limit
  - Demonstrates this with the 22.5 kg curls, noting he finds them manageable from consistent heavy training
- Cautions against steroid use by citing Larry Wheels as an example
  - "You see like Larry Wheels throws a punch, bicep falls down, ligaments tendons — they don't grow, everything falls apart"
  - Steroids can accelerate muscle growth faster than tendons/ligaments can adapt, leading to injury
- The natural path — his four pillars:
  - Lift heavy consistently
  - Push yourself to the limits each session
  - Eat clean
  - Live clean, no substance abuse
- Timeline: he is turning **34** and credits years and years of patient, natural training for his current size and strength
- The overarching message: **sustainability** is the key to building a "mega strong" Viking build
