

Looking Good Vs Protecting Your Family

Channel: Onem · Published: Aug 27, 2026 · Watch: https://www.youtube.com/shorts/M_1VLrHeKgU Source: full transcript

Executive Summary

The creator warns against chasing extreme fitness aesthetics — either too shredded or steroid-bulky — arguing that a functional, athletic physique built through real-world labour and movement is what actually matters when your family's safety is on the line.

-  His Own Physique Philosophy
-  Manual Labour as the Real Training
-  Why Steroids Produce Weakness, Not Strength
-  Calling Out Aesthetic Influencers by Name
-  The Real-World Test: Protecting Your Family

The Problem with Extreme Fitness Goals 0:00

- Many people in the fitness world are chasing goals that actively work against them
 - Getting **too shredded**: erectile dysfunction and feeling terrible every day
 - Getting too big/bulky with a "steroid look": health risks and loss of proper movement
- The core critique is that both extremes prioritise appearance over function

His Own Physique Philosophy 0:22

- Describes his own build as a "Statham style physique" — in good shape and fairly shredded, but not extreme
 - Jason Statham reference signals: lean, strong, mobile, and capable rather than mass-monster or ultra-cut
- Claims to be able to move freely AND lift heavy — the combination he sees as optimal
- Background includes manual labour, rugby, sports, and calisthenics

Manual Labour as the Real Training 0:22

- Identifies manual labour — specifically **wheelbarrowing and using a shovel** — as the single biggest contributor to his physique
 - "Manual labor was the big one"

- Holding a wheelbarrow for hours on end built his back significantly
- Demonstrates (or attempts to demonstrate) his back development on camera
 - States he **does not train his back at all** yet has a notably large back
- The implication: functional, prolonged real-world effort builds more transferable muscle than gym isolation work

Why Steroids Produce Weakness, Not Strength 1:07

- Claims he could outlift "any of these steroid boys"
- His reasoning for why steroid users are actually weak:
 - Muscles grow from steroids
 - **Ligaments, tendons, and bones do not grow** to match
 - Result: large muscles on a frame that cannot support or express real strength
 - "You just kind of get big muscles, you look the part, but you're actually pretty weak"
- Every steroid user he has trained with, in his experience, "don't really have it" and don't move properly — he characterises it as stiffness with no fluidity

Calling Out Aesthetic Influencers by Name 1:28

- Stresses he is not trying to call people out personally and expresses genuine respect for each
- **Mike Thurston** — fitness influencer; creator says he has seen Thurston box and notes no fluidity, no proper body movement, just stiffness; "Hey Mike"
- **Alex Hormozi** — entrepreneur/fitness personality; creator says "he can't jog" which he finds alarming
- **Larry Wheels** — powerlifter/social media personality; creator notes he recently saw footage of Wheels boxing, threw a punch, and "bicep falls off" — referencing a torn bicep injury as evidence of the tendon/ligament weakness argument
- Concedes clearly: "They look better than me, a million percent" — the aesthetic advantage is not disputed
 - The dispute is purely about functional, real-world physical performance
- Additional capability gaps cited for oversized/steroid physiques:
 - Cannot do a muscle-up
 - Unlikely to be able to wrestle
 - Poor cardio endurance
 - No "snap" in the body — lack of explosive, fluid movement

The Real-World Test: Protecting Your Family 2:12

- Frames the entire argument around a single visceral scenario: a predator grabs his daughter and runs
 - "I want to be able to just sprint down the road and just tackle that guy"
 - Contrasts this with someone like Hormozi who "can't jog" — framed as a genuine safety failure

- Secondary scenario: a home intruder
 - References Larry Wheels as an example of someone who, despite size, may lack the functional ability to fight someone off
 - Notes that even Mike Tyson (implied: a large, powerful but not functionally mobile physique type) would "run out of energy pretty quick" — low cardio, limited snap
 - "What's he going to do? Just like kind of push him?"

Core takeaway: "Having this sort of frame is optimal life" — a functional, athletic, mobile build that can actually perform under real physical pressure is worth more than any aesthetic extreme.

- The explicit value hierarchy proposed:
 - Functional movement > muscle size
 - Real-world capability > appearance
 - Protecting people you love > looking good on social media
