

The 90-Day Plan to Get Ripped and Rich EP 311

Channel: Brandon Carter · Published: Jul 01, 2026 · Watch: <https://www.youtube.com/watch?v=gM-iBi2xALK> Source: full transcript

Executive Summary

Brandon Carter lays out a detailed, month-by-month 90-day plan to get visibly lean and launch a profitable service-based business simultaneously, using NEAT, AI calorie tracking, testimonial harvesting, and a structured content strategy.

Show Intro & Sponsors 0:50

- Victory Talk Podcast, Episode 311 — live every Tuesday and Thursday at 5:00 p.m. Eastern
- Host: Brandon Carter (a.k.a. Big Brandon Carter, King Keto, "Gymnasium Jesus")
- Co-host: Movia / DJ Chaita Grande reads super chats
- **Sponsor 1 — Free ebook:** "7-Day AI Action Plan for Online Trainers"
 - 100% free download; link in description
 - Claims a reader can land their first online client within 7 days following the guide
- **Sponsor 2 — Brandon's personal online coaching:**
 - Currently accepting new clients for summer
 - Process: fill out application via link in description → receive automated text within minutes → must reply to that text or application is ignored → Brandon then responds manually
 - Has been doing online training since 2009, before Instagram existed

- **Sponsor 3 (satirical) — "Thot Repellent":** a joke cologne product; super chats fund its development; targeting Lowe's and Home Depot distribution
- **Paid ads resource mentioned:** Jeremy Haynes' course "Digital Marketing Mastery" (DM Jeremy to check availability); also briefly mentioned "Nat Matt" but couldn't confirm details

💡 Mindset Story: LL Cool J, Haters, and Being Inspired 1:22

- Brandon was signed to Sony Records as a rapper; dropped when Sony merged with BMG
- Built his deal through rap battles across the Mid-Atlantic: DC, Philly, New York, New Jersey — attended every open mic and battle while at Howard University
- At Howard's Homecoming "Yard Fest," Brandon opened for LL Cool J (LL was a surprise guest)
 - LL had the song "Love You Better" out at the time and was in what Brandon describes as his best-ever physical shape
- After Brandon's set, a girl he liked literally shoved him aside to rush the stage for LL
 - LL was nearly 40 at the time; many guys hated on him for it
- **Brandon's response:** Instead of hating, he bought LL's book when it came out to learn from him
- Key lesson: "If you see somebody doing better than you, you want to be inspired by it... haters don't never win."
 - Notes Craig Duc as the only hater he's ever seen become successful — "a sample size of one"
 - Haters end up bitter, unsuccessful, and isolated; nobody wants to be around them
- Outcome: Brandon's girlfriend (podcast co-host) is "finer" than the girl who pushed him; he's in the best shape of his life
- Takeaway: When you see someone excelling, ask *what can I learn from them* — don't resent them

🔥 How Your Body Burns Calories (The Four Systems) 19:50

- Caloric deficit is the only mechanism for fat loss: burn more calories than you consume
- Four ways the body burns calories:

System	What It Is	% of Total Calories Burned
BMR (Basal Metabolic Rate)	Calories burned keeping you alive (organs, heart, etc.)	60–70%
TEF (Thermal Effect of Food)	Calories burned digesting food	8–15%
EAT (Exercise Activity Thermogenesis)	Calories burned during actual workouts	0–10%
NEAT (Non-Exercise Activity Thermogenesis)	Calories burned moving around day-to-day	15–25%+

- Exercise (EAT) is a surprisingly small lever — aerobic instructors with desk jobs still had belly fat because cardio alone doesn't burn enough
- NEAT is the **biggest controllable lever** and the one most people ignore
- Traditional cardio drawbacks:
 - Running 1 mile burns ~100 calories — erased by a handful of almonds or a banana
 - High-intensity cardio triggers hunger hormones (leptin and ghrelin), causing appetite compensation
 - Intense cardio is hard on the central nervous system, reduces NEAT output, requires recovery, and can impair weight training
 - Sprinting is essentially resistance training — demands full recovery

NEAT & the 20,000 Steps-Per-Day Protocol 23:03

- Target: **20,000 steps per day**
 - Most people average 2,000–4,000 steps; suburban/rural residents often even less
 - People in non-walkable areas are statistically fatter because they drive everywhere
- Why walking is superior to cardio for fat loss:
 - A 200 lb person burns **over 1,000 extra calories** walking 20,000 steps
 - Burning 1,000 calories via running would require ~10 miles — hard on joints and CNS
 - Walking doesn't require recovery, doesn't spike hunger hormones, and doesn't impair lifting
- Estimated gross calorie burn from 20,000 steps by body weight:
 - 140 lbs → ~740 calories
 - 200 lbs → ~1,000+ calories
- How to break up the 20,000 steps (doesn't have to be consecutive):
 - Morning: ~4,000–5,000 steps (30–45 min)
 - After lunch: ~5,000 steps
 - After work: ~5,000 steps
 - Evening: ~5,000 steps
 - Total time: roughly 3+ hours spread through the day
- Treadmill desk hack: study your business skill or consume content while walking — Brandon does this regularly with an iPad at the gym
- Wearables recommended for tracking steps and calories:
 - Apple Watch, Garmin, Whoop, or Oura Ring (Brandon's preference — blends with formal attire)
 - iPhone alone can also track steps if no wearable available
- Track **gross calories** (not just active calories) to account for BMR running in the background

Diet: Calories, Protein, and AI Tracking 27:03

- **Calorie target:** body weight in pounds × 10

- Example: 200 lb person → 2,000 calories/day
- Brandon is currently cutting at 2,000 calories/day
- Applies to most people 300 lbs and under; very obese individuals may need adjustment
- **Protein target:** 1 gram per pound of body weight
 - Preserves muscle mass during a cut
 - In year one of training, sufficient protein + lifting can allow simultaneous muscle gain and fat loss — a window that closes after the first year
 - For overweight individuals: use ChatGPT with a shirtless photo to estimate body fat % → calculate lean body mass → use 1–1.2g protein per pound of lean mass instead
- **Fat loss math:**
 - 1 lb of fat = 3,500 calories
 - 500 cal/day deficit → 1 lb fat loss/week
 - 1,000 cal/day deficit → 2 lbs fat loss/week
 - 1,000 cal/day deficit × 7 days = 7,000 cal = 2 lbs fat
- **AI Calorie Tracking System (Claude-based):**
 - Brandon uses Claude (not ChatGPT, Gemini, or Grok) because Claude syncs natively with Apple Health
 - Process:
 - Take a photo of a food label or describe what you ate → Claude logs macros and calories
 - Claude pulls Apple Health data to see calories burned throughout the day
 - Claude calculates running caloric deficit throughout the day
 - Can ask Claude to suggest food combinations to hit remaining macro targets
 - For non-Apple Health users: screenshot wearable app data (Garmin, Oura Ring) and paste into any AI → it calculates deficit
 - DM Brandon on Instagram (@KingKeto) the word **"tracking"** to receive the prompt automatically
 - Works with ChatGPT too but without Apple Health sync; screenshot workaround available
- **Tracking weight:** don't weigh yourself daily — fluctuations from hydration, food volume, and bathroom habits are misleading; track the **week-over-week trend line** instead
- **Lifting approach during a cut:**
 - Train 3–5x per week
 - Full body workouts are preferred (what Brandon has done exclusively for 10+ years)
 - Alternatively: upper/lower split, or push/pull/legs (requires 6 days/week to hit each muscle group twice)
 - **Lift heavy even while cutting** — high reps during a cut is a mistake; heavy lifting signals the body to retain muscle

Blood Work, TRT, and Peptides 32:07

- Recommends getting blood work done, especially for men over 30–35
 - Testosterone naturally starts declining around age 30 (sometimes as early as 25)

- Brandon's TRT experience:
 - Got blood work done before turning 40; felt fatigued; testosterone was at the low end of normal range
 - Doctor offered TRT to bring him to the **high end of the normal range**
 - Current testosterone: ~900 ng/dL (comparable to his levels in his 20s)
 - Still within normal range — not "doing roids"; monitored regularly and dosage is adjusted if levels go too high
 - Benefits: more energy, easier fat loss, performance improvement
- **Peptide stack Brandon is currently on (week 1–2):**
 - BPC-157
 - Eparlin
 - Trapazide (makes him not hungry at all even at low 2.5 mg dose; studies used up to 6 mg)
 - Matsi
 - Tesofensine — FDA approved for weight loss
- Recommendation: **only get peptides from a licensed doctor** — never from random Chinese websites or TikTok sourcing; gray market powder is illegal
 - BPC-157, Eparlin, Matsi are not FDA-approved but doctors are legally allowed to prescribe them
- Wearable for calorie tracking: Oura Ring is Brandon's top pick for professional attire compatibility

Why a Service-Based Business is the Best First Business 35:44

- The fastest path to wealth: own your own business (or start a side hustle alongside your job)
- **Service-based business advantages over product-based:**

	Product Business	Service Business
Startup Cost	High	Low
Overhead	High	Low
Risk of Failure	Higher	Lower

- Example service businesses:
 - Facebook/Google/TikTok ads management
 - Video editing
 - Lead generation
 - Online personal training (Brandon's first business — how he made his **first million**)
- Brandon has taught **over 15,000 people** to grow successful online fitness businesses
- Student success examples:
 - Jen: made \$33,000 in under 2 months, full-time job + 2 kids, no prior training experience
 - Will: full-time job, made \$50,000 in first 4 months
 - Angelo: full-time trucker (80 hrs/week), made \$11,000 in first 6 weeks as online trainer

- Key insight: you can learn **any skill to proficiency in 100 hours** of focused study and practice

The 90-Day Month-by-Month Game Plan 16:39

- Overview: build body and bank account simultaneously — they are not mutually exclusive
- Sacrifices required for 90 days:
 - Stop eating out and eating junk on weekends
 - Stop scrolling TikTok/Instagram at night
 - Give up junk food and gaming temporarily

Month 1 — Foundation

- **Body:**
 - Lock in calorie target (bodyweight × 10) and protein target (1g/lb bodyweight)
 - Schedule workouts AND step sessions in your calendar — if it's not scheduled, it won't happen
 - Get blood work done; consult a physician (especially if 35+)
 - Get a wearable (Apple Watch, Garmin, Whoop, or Oura Ring)
 - Begin building the habit of AI-assisted calorie tracking
 - If very out of shape, start with 5K–10K steps and build up; if under 200 lbs, start at 20K
- **Business:**
 - Pick your service (ads, video editing, lead gen, online training, etc.)
 - Block **4 hours/day** of dedicated study time in your calendar
 - Study 4 hrs/day × 6 days/week OR 3 hrs/day × 7 days/week → reaches ~100 hours
 - Start posting short-form content daily on TikTok, Instagram Reels, and YouTube Shorts
 - Don't worry about quality yet — nobody is watching; you're building the content creation skill
 - Teaching what you're learning accelerates your own understanding
 - Combine study and walking: bring iPad/laptop to treadmill or elliptical

Month 2 — Refine & Harvest

- **Body:**
 - Recalculate calorie targets weekly as weight drops
 - Refine AI tracking setup; DM Brandon for updated prompt if needed
 - Maintain or increase workout intensity
 - Get follow-up blood work to assess how optimization protocols are affecting you; adjust dosages as needed
- **Business:**
 - 100 hours of study should be complete → launch the **Testimonial Harvest**
 - Announce on social media and to personal network: offering free services in exchange for testimonials

- Recruit **at least 5 free clients** (online training dropout rate is ~50%, so you need 5 to get 2–3 solid testimonials)
- Go all-in on getting results for these free clients
- Content quality should visibly improve from Month 1 feedback

Month 3 — Get Paid

- **Body:**
 - Diet habits should feel automatic; routine locked in
 - People around you will start asking "What have you been doing?" — visible transformation
 - Confidence improves; Brandon notes after 27 years of training people, every area of life improves once someone gets in shape: relationships, parenting, work, business
 - Reset calorie targets again and push through
- **Business:**
 - Free clients should have results; collect testimonials, before/after, and stories
 - Broadcast results on social media accounts that have been building for 2 months
 - Offer free clients a discounted rate to continue — these often become first paying clients
 - Use testimonials to attract new paying clients
 - Start converting social media following into paid clients

The whole game plan distilled: learn the skill (100 hours) → help people for free (testimonial harvest) → use proof to sell. Applied to fitness: calorie math + 20K steps + lifting + protein = visible results in 90 days.

Stock Market Update with Young Candlestick Greg [52:56](#)

- Co-analyst: Young Candlestick Greg
- Greg has been "neutral" on the market for June–July; market has traded sideways confirming his view
- Strategy when neutral: buy oversold dips, don't get greedy near resistance
- **Broad market:**
 - Semiconductors are holding the market up; bullish so long as they continue
 - TSM (Taiwan Semiconductor) hit new all-time closing highs
 - AMD breaking out to new all-time highs
 - Nvidia lagging — sloppy price action; tried to hold a retest, undershot it
 - IWM making all-time highs = still bullish overall; rising wedge pattern present but needs a confirmed break to turn bearish
 - Trump tends to pump markets going into holidays (Fourth of July context); if market dips the day before, Greg sees it as a buy
- **Sector plays:**

- **Long: XLV (Healthcare ETF)** — Eli Lilly hit new all-time highs while broad market hasn't; Greg targets XLV from ~\$158 to \$180 by year-end (~13–14% move)
 - UNH calls from the prior Thursday show went 7x on Friday
 - UNH trade idea: long over \$420, stop at \$413; risk ~2%, potential 5–10%+ gain
- **Long: XLI (Industrials)** — outperforming S&P recently; 5–10% upside to year-end; favorite name = Caterpillar (CAT) at all-time highs
 - Liquidity issue: XLI bid-ask spreads are very wide (\$480 of variability) — best approach is buying shares directly
- **Short: XLF (Financials)** — Greg's favorite short; XLF is same price as mid-2025 while Nasdaq is much higher
 - Trade idea: Buy Oct 16 expiration, in-the-money 54-strike put for ~\$170; potential to grow to \$400–\$500 if financials drop
 - Set price alert below \$53.23 for confirmation
- **Short: Bitcoin** — basing *below* its breakdown point (bearish structure); if BTC breaks below \$58K, could get "pretty ugly"
 - IBIT puts as the vehicle
- **Short: MSTR (MicroStrategy)** — Greg opened a short position; Michael Saylor facing lawsuits because preferred shares guaranteed a rate of return but the ETF he managed dropped ~40%; may be forced to sell MSTR shares to fund legal settlement; Greg predicts 20–30% drop within 2 weeks
 - Has bearish call credit spreads; may add put debit spreads
- **Short: Ethereum** — higher beta than Bitcoin; short under \$1,500; wouldn't be surprised to see it drop below \$1,000; Tom Lee had a \$50K price target (currently ~\$1,500)
 - ETH ETF puts available; implied volatility skew shows puts priced higher than calls — market signaling downside
- **Long: HIMS** — healthcare/peptide space; basing above resistance; look for longs over \$35–\$36
- **Watchlist: Axon (AXON)** — buy on pullback to \$515; set a price alert
- **GLW:** Recent Victory Trades breakout alert; already moved — too late to enter now; used as example of flat-top breakout + rising RS line = buy signal
- **Nike (NKE):** Raised guidance for first time in a while but stock still dropping; fair value per CFAs = \$98/share; currently at \$41; chart is bearish but fundamentally cheap
 - Greg will day trade calls if Nike breaks above \$42; options are cheap due to compressed premium; potential 4x if Nike moves up 5%
- **Bullish credit spread explained:** You're betting a stock stays above a certain price by a certain date; if it does, you collect max profit; income strategy; high probability but requires more capital; capped loss (~150%) if wrong
- **Options skew insight:** If at-the-money put is more expensive than at-the-money call, the market is pricing in downside — useful directional signal (~2/3 reliability per Greg)

- **Day trading framework:** Look for impulse wave → pullback → retest of resistance → breakout above = buy setup; stop loss under prior candle low; identify which side (buyers or sellers) is "trapped"
- **Victory Trades wins shown (that day):** 73%, 106%, 58%, 124% (Amazon), \$611 profit trade, \$200 turned into \$300 in a week
- Victory Trades membership: live trading room every morning with Greg and Brandon; trade alerts to phone; link in description

Mindset Q&A: How to Overcome Hitting a Wall 1:14:10

- Question from Alexander: "When you've done everything right but things still don't go your way — how do you break that disappointment?"
- Brandon's framework: **focus on behaviors, not outcomes**
 - When you focus on the goal and it feels far away, it becomes demoralizing
 - Instead, identify the daily actions required to reach the goal and **make each day a victory**
 - Example: weight loss goal → daily actions = track macros, work out → if you did those today, today was a success regardless of scale movement
 - Stacking daily victories → dramatically increases probability of hitting the goal
- Most failures are actually effort miscalculations:
 - Most goals are not zero-sum (unlike sports championships where only one team wins)
 - It is "super rare" that someone truly goes all-out and fails
 - Most people significantly underestimate the effort required to accomplish a goal
- **The Bug Analogy:**
 - Most people try to swat a bug (they might miss) — equivalent to asking "what do I need to do to accomplish this goal?"
 - Better approach: fumigate the building — ask **"what kind of effort would make failure impossible?"**
 - If you list everything that effort would require and realize you don't want to do it → recalibrate your expectations honestly
 - If you do it → failure becomes nearly impossible
- Brandon's challenge to Alexander: "Did you actually ask yourself, 'what effort would make failure impossible?' Or did you just say 'I'm gonna try'?"
- Only you know the honest answer — but going all-out on this question and then executing is the path forward

Fat Loss Deep Dive Recap 1:25:10

- Brandon reiterates the full fat loss framework for newcomers who missed the first half
- "Fat loss is simple, not easy — most people are too soft to do it"
- All four calorie-burning systems restated (BMR 60–70%, TEF 8–15%, EAT 0–10%, NEAT 15–25%+)
- NEAT advantages over traditional cardio restated:

- Cardio triggers appetite compensation via leptin and ghrelin
- Intense cardio suppresses NEAT in recovery windows
- Walking is low-stress, doesn't require recovery, doesn't impair lifting
- **Prescription summary:**
 - 20,000 steps/day (break into segments; ~3+ hours total)
 - Bodyweight × 10 = daily calorie target
 - 1g protein per pound bodyweight
 - Weight training 3–5x/week (full body preferred; lift heavy even during cut)
- Deficit projections:
 - 160 lb person following protocol → ~1,000 cal/day deficit → 2 lbs/week fat loss
 - Larger person (250–300 lb) → 1,300–1,500 cal/day deficit → 2–3 lbs/week fat loss
- "The bigger you are, the faster you lose weight" — larger people are naturally in bigger deficits on the same protocol
- AI tracking walkthrough repeated:
 - Photo of food label → Claude logs macros → running total updated → Apple Health sync shows burn → deficit calculated in real-time
 - Can ask Claude: "What combination of these foods should I eat to hit my remaining macros?"
 - Prompt available via Instagram DM: @KingKeto, word = **"tracking"**
- Track week-over-week trend, not daily weight — scale fluctuates from hydration, food volume, digestion
- Month 1: establish protocol; Month 2: adjust calories as weight drops; Month 3: tighten everything and push through
- Resources: free 7-Day AI Action Plan ebook (link in description); online coaching application (link in description; must respond to automated text to be considered)
