

How to Get Shredded in 30 Days: 5 Steps

Channel: Brandon Carter · Published: Sep 29, 2026 · Watch: <https://www.youtube.com/shorts/WHJHU54dGHI> Source: full transcript

Executive Summary

Brandon Carter outlines a no-fluff, 5-step daily protocol — steps, water, sleep, calorie deficit, and high protein — to get lean within 30 days, backed by brief physiological explanations.

Contents

-  Step 1: Walk 20,000 Steps Every Day
-  Step 2: Drink 1–2 Gallons of Water Daily
-  Step 3: Sleep 7–8 Hours Every Night
-  Step 4: Eat Bodyweight (lbs) × 10 Calories
-  Step 5: Eat 1 Gram of Protein Per Pound of Bodyweight

Step 1: Walk 20,000 Steps Every Day 0:00

- Target: **20,000 steps per day**
 - An average person doing this will burn an extra **800–1,000 calories** on top of their normal expenditure
 - This is presented as the foundational activity multiplier for the plan

Step 2: Drink 1–2 Gallons of Water Daily 0:21

- Target: **1 to 2 gallons of water** every day
- Fat burning is described as a **two-step process**:
 - **Lipolysis** — fat cells break down into fatty acids
 - **Oxidation** — the body uses those fatty acids as energy
 - Both steps require adequate water to function properly
- Additional benefits of high water intake:
 - Increased energy levels
 - Keeps you feeling full, reducing the urge to overeat

Step 3: Sleep 7–8 Hours Every Night 0:21

- Target: **7 to 8 hours** of sleep per night
- Critical warning: if you are in a calorie deficit but not sleeping enough, your body will **burn muscle instead of fat**

- This produces the opposite of the desired result — you end up looking worse, not better
- Sleep is positioned as non-negotiable for body composition, not just recovery

Step 4: Eat Bodyweight (lbs) × 10 Calories [0:41](#)

- Formula: **bodyweight in pounds × 10 = daily calorie target**
- Example given:
 - Brandon weighs ~**200 lbs**, so he eats **2,000 calories per day** when cutting
 - "Not one calorie more"
- This creates the calorie deficit needed for fat loss without extreme restriction

Step 5: Eat 1 Gram of Protein Per Pound of Bodyweight [0:62](#)

- Formula: **1 gram of protein per pound of bodyweight** daily
- Addresses a common objection directly:
 - Q: "What if someone weighs 300 lbs — do they eat 300g of protein?"
 - A: "Yes, exactly that."
- Scientific rationale — the **thermic effect of food (TEF)**:
 - Every time you eat, you burn calories digesting the food
 - Protein requires **more calories to digest** than any other macronutrient
 - Roughly **2× more than carbohydrates**
 - Roughly **3× more than fat**
 - High protein intake therefore boosts calorie burn passively through digestion
