Executive Summary

A self-driving forklift uses small white strips on walls and columns to navigate freely inside a warehouse, transporting goods autonomously between a filling machine and a packaging machine — no tracks, rails, or remote operator needed.

Contents

-  Self-Driving Forklift in Action

Self-Driving Forklift in Action [0:00](#)

- The subject of the clip is an autonomous (self-driving) forklift operating inside what appears to be a manufacturing or logistics facility
 - The narrator expresses clear amazement, calling it "crazy"
- How it navigates — three things it does NOT use:
 - No fixed tracks on the floor
 - No iron/metal rails
 - No human operator with a remote control
- What it DOES use for navigation:
 - Small white strips placed on the sides of columns and walls throughout the facility
 - These markers allow the forklift to determine its position and move freely around the space
- Apparent task being performed:
 - Transporting goods/cargo from a **filling machine** to a **multi-package wrapping/packaging machine**

"It knows where it is and roams freely in this place" — capturing how the strip-based system replaces all traditional guidance infrastructure.
