

Get Your Body and Bank Account Right This Summer ■ EP 307

Channel: Brandon Carter · Published: Jun 17, 2026 · Watch: <https://www.youtube.com/watch?v=5EZaF9YzXIA> Source: full transcript

Executive Summary

Brandon Carter outlines three rules for getting ripped and rich in 90 days: track calories in and out using AI tools, spend four focused daily hours on your single most important task, and plan every hour in Google Calendar to eliminate wasted time and bad habits.

Detailed Breakdown

• Intro & Context

- Episode 307 of Victory Talk podcast; host Big Brandon Carter (King Keto, Gymnasium Jesus, Unimus Prime)
- Co-host/chat moderator: DJ Chita Grande
- Premise: 90 days is enough to be in best shape of your life AND have significantly more disposable income
- Motivation: observed dads swimming with shirts on at Disney cruise — don't accept that as your summer
- Ants vs. grasshopper fable: those who work hard in summer thrive in winter; those who slack suffer

Key problem: most people take actions that *look* like progress but are just motion (eating smoothies without tracking calories; spending months designing a logo instead of getting clients)

Sponsors & Promotions

Free live training on **June 28th** (Sunday) on growing an online fitness business using AI

- Brandon made his first million as an online trainer; has taught 15,000+ people
- No experience required; covers AI tools for content and client acquisition
- Register via link in description
- One-on-one personal training: apply via second link in description; must respond to the automated text message to be considered

"Thought Repellent" — novelty spray product; goal to release by July 4th if enough super chats fund distribution

Rule 1 — Track Everything That Matters

The math of fat loss

- 1 lb of fat = 3,500 calories
- 500 cal/day deficit → 1 lb lost/week ($500 \times 7 = 3,500$)
- 1,000 cal/day deficit → 2 lbs lost/week
- Eating "healthy" without tracking still causes fat gain — people do it constantly
- Duke University study: subjects tracked calories with no diet or workout plan → lost an average of 5 lbs in 3 months just from awareness changing behavior

Track calories burned — get a wearable

- Options: Oura Ring (Brandon's preference), Apple Watch, Garmin, Whoop
- Brandon prefers Oura Ring because it blends into all attire including formal wear
- Whoop looks odd with a suit; Apple Watch feels like a medical device; Samsung Watch is a joke
- Devices are not 100% accurate but provide a workable range; can upload screenshots (e.g., Oura app) directly to Claude to correct discrepancies

Track calories consumed — use Claude AI (or ChatGPT)

- Brandon used MyFitnessPal for 10+ years; now experimenting with Claude
- Set up a long custom prompt in Claude (DM the word *tracking* to Brandon on Instagram to receive it)
- Log food by typing what you ate or photographing the plate/label and uploading directly to the chat
- Claude gives macros, calories, and a **running daily total**
- Claude-exclusive feature: can connect to Apple Health data and display real-time caloric burn alongside intake → shows exact surplus or deficit at any moment
- ChatGPT works similarly but can't pull Apple Health data natively; can still accept screenshot uploads
- Weigh food when possible for accuracy; when not possible (e.g., catered events, restaurants), photograph the plate, describe what it is, and Claude estimates — tested against actual weights, within acceptable range
- Sauces and cooked-in ingredients: just describe them verbally (e.g., "hibachi sauce") — easier than MyFitnessPal
- Start a new session each day by telling Claude "new day" and it resets the running total

Daily targets

- Calories: $\text{bodyweight (lbs)} \times 10 = \text{daily calorie goal}$ (200 lbs → 2,000 cal)
- Protein: $\text{bodyweight (lbs)} \times 1 = \text{daily grams of protein}$ (200 lbs → 200g protein)
- Beginners (first year of serious training): this approach burns fat AND builds muscle simultaneously
- Experienced trainees: high protein preserves muscle during a cut

- Brandon's own day example: 2,000 cal, 240g protein, carbs under 50g (keto), fat remainder

Optional workout additions

- Diet is the most important factor; "you can't out-train a bad diet, but you can outdiet bad training"
- To accelerate: 30–60 min steady-state cardio daily — walking, stationary bike, elliptical at conversational pace (not high-intensity)
- Resistance training: 3–4 full-body workouts per week; 1–2 exercises per body part; 3–4 sets each
- Kids and family can be used to burn extra calories (trampoline parks, water gun fights, walking)

Rule 2 — Stop Working on Bullshit; Focus on the One Thing

Inspired by the book *The One Thing* by Gary Keller (author was worth hundreds of millions when he wrote it ~20 years ago)

- Core question: "What's the one thing that, if you accomplished it, would make everything else easier or unnecessary?"
- Work on that one thing for **4 focused hours per day** — no notifications, no distractions
- Does NOT have to be 4 consecutive hours: can split into 2 hrs morning + 2 hrs evening
- Does NOT have to be 4 hrs every single day: average 4 hrs/day across the week (miss Friday → do 8 hrs Saturday, or 6 hrs Saturday + 6 hrs Sunday)
- **Studying and reading do NOT count** toward the 4 hours — must be actually doing the thing
- Brandon's own one thing: **content creation** — "content makes everything else easier or unnecessary" for online fitness business
- Promise: "If you put in 4 focused hours a day on your one thing, you will not fail."

Common mistake: people spend months on logos, business names, or studying instead of doing revenue-generating activities

Rule 3 — Live Out of Your Calendar

"I don't have time" is false; you're just not using time effectively

- Recommended tool: **Google Calendar only**

Two types of tasks:

- **Recurring tasks:** sleep, wake-up, gym, meals, work hours, commute, family time, date night — lock these in as repeating events
- **One-time tasks:** vary daily/weekly; schedule these as they come up with no open/empty slots

How to build the calendar (step-by-step example shown live)

- Block sleep: e.g., 10 PM – 6 AM, recurring daily (consistent sleep/wake time sets circadian rhythm)
- Block work: e.g., 9 AM – 5 PM, recurring weekdays
- Block commute: ~1 hour each way (if commute is over 1 hour, consider moving closer to work)
- Block gym: 1 hour, recurring daily
- Block family time / date night (e.g., Tuesdays)
- Block **"one thing" deep work:** target 28 total hrs/week to average 4 hrs/day
- Example layout: 2 hrs Wednesday + 2 hrs Tuesday/Friday + 6 hrs Saturday + 6 hrs Sunday ≈ 28 hrs
- No white space — "white space is the devil"; every hour has a purpose

Side effect: bad habits disappear automatically

- If it's not in the calendar, it doesn't happen
- Brandon quit smoking weed and drinking alcohol 11 years ago — not intentionally, just never scheduled it
- Won't schedule Call of Duty, doom-scrolling, or time-wasting activities

Addressing common excuses

- Kids: use them as motivation, not excuses; go to trampoline parks, do water gun fights, take walks together — all burn calories; wear your Apple Watch during kid activities and track it
- Girlfriend cooks too much: still your responsibility what you put in your mouth; Brandon's girlfriend weighs his food and cooks to support his goals — but even if she didn't, it's on you
- "I used to be in shape before kids": don't make your children carry the burden of your failure

90-Day Challenge Recap

- Track calories consumed (AI prompt with Claude) + protein — calories and protein are the only two macros that truly matter; handle carbs/fat however you prefer
- Track calories burned (wearable device)
- Live out of your calendar — zero white space
- 4 focused hours/day on your one thing

Expected results in 90 days: best shape of your life, more disposable income, higher mental drive, more confidence, more energy, more respect from family and peers, better health

Market Recap Segment — Young Candlestick (Greg, Series 65)

Market backdrop: Trump peace deal signed Sunday, SpaceX IPO, FOMC meeting with new Fed chair Worsh

- **S&P 500:** Up big yesterday, pulling back today; base case = sideways summer; overbought after prior oversold bounce; no huge upside or major sell-offs expected
- **IWM (small caps):** Stair-stepping higher but possible rising wedge pattern; if it loses prior all-time highs → bearish signal for broader market
- **Semiconductors:** Had a big -5% down day; have been on a strong run; may see further weakness/softness over coming weeks
- **NBIS (Nebius — AI data centers):** Being added to NASDAQ 100 / QQQ (bullish catalyst); up 210% YTD; near all-time highs; next setup is buying breakout above \$278
- **Crude oil:** Sold off hard after peace deal; technical rounding top; could dip to ~\$60/barrel; Greg views that as a dip-buy; gas prices unlikely to go below \$3/gallon nationally long-term
- **Iran deal context:** Trump deal reportedly gives Iran access to \$300B vs. Obama's \$1.7B deal; lowers oil prices in short term which could give Fed room to cut rates, though no rate cuts currently priced in for the year
- **Bitcoin:** Lower lows + dead cat bounce; not doing much
- **VIX:** Spiked, came back down; starting to form a small bottom → possible short-term market sell-off
- **FOMC:** New Fed chair Worsh wants to raise rates → harder to borrow, slows business growth, but should gradually reduce cost of living; market will spike hard up or down on the announcement
- **SpaceX (SPCX):** Ran from \$149 to \$225; options now available but very expensive (pricing in high volatility); Greg likes selling **bullish put credit spreads at \$175 into Friday** — risk ~\$450 to make ~\$50, ~90% probability of profit; gamma squeeze possible above all-time highs
- **Google:** Up 20% YTD; owns 7% of SpaceX; Greg bought shares and added more recently; near highs but not at highs
- **Microsoft:** Weak, out of rotation; can't catch a bid despite being a strong company; Greg bought at \$390 and averaged up at \$400
- **Apple:** Near all-time highs, performing well
- **Meta:** Below all-time highs; stuck in consolidation
- **Netflix:** Bleeding since last earnings; fair value ~\$120/share (50% upside from current ~\$78); trend is bearish; Greg would wait for stock to establish a new chart formation around \$85 before entering
- **Caterpillar (CAT):** Breaking out to all-time highs — industrial stock pick
- **TSM (Taiwan Semiconductor):** Greg's favorite semiconductor stock; building large plants; target of \$1,000 in 3 years (currently ~\$425) — potential to reliably double money; pays a dividend; Greg sells monthly bullish put credit spreads
- **PDT rule update:** \$25K minimum for day trading no longer applies; with a margin account you can enter and exit freely — but still wait for quality setups
- **Victory Trades wins shown:** HMS flat-top breakout → \$200 profit (2 months of subscription paid in one trade); \$99 into \$550 (455% gain); Greg's own scalp: \$97 into \$217 on a put
- **Tomorrow:** Greg trading FOMC live twice — either a big green day or a red day

Possible future speculation: Tesla, X (Twitter), and SpaceX merging under single ticker "X"

Super Chat Q&A Highlights

- Disney cruise recap: Brandon's son said it was "one of the best days of my life" — emotionally meaningful; Brandon was fully active (swimming with dolphins, running around the ship)
- Book recommendation for mindset: *Awaken the Giant Within* by Tony Robbins — read the physical book, not the abridged audio version; in Brandon's top 5 all-time
- Viewer Jesse: lost from 19% to ~10% body fat using keto + caffeine + bronade + 1,000 cal deficit with no hunger — Brandon compares this favorably to GLP-1 drugs like Ozempic without the "Ozempic face" (muscle loss including facial muscles from over-suppressed appetite)
- Trading practice: Brandon logged exactly 200 hours of simulated trading on NinjaTrader using historical data before earning his first \$50K payout from Apex Funded
- 6'6" / 265 lbs viewer: needs to cut — cap calories at ~3,000/day, target ~300g protein; definition comes from low body fat, not more lifting; men hold most fat cells in the stomach ("Bart Simpson build")
- Viewer wanting to lose 60 lbs by December (24 weeks): 1,000 cal/day deficit = ~2 lbs/week = ~48 lbs in 24 weeks; add one 24-hour fast per week to bridge the gap to 60 lbs
- Shoutout to Andre: black guitar teacher with dreadlocks who influenced Brandon to buy the PRS Silver Sky SE over the more expensive standard version (saving ~\$2,000); also lost weight from 195 to 181 and building his guitar lesson business
