

AI is completely disrupting the ecom sector

Channel: Arie Scherson · Published: Jun 14, 2026 · Watch: <https://www.youtube.com/shorts/zojCs22EfNc> Source: full transcript

Executive Summary

AI-powered customer service tools are slashing costs for e-commerce brands, with seven- and eight-figure-per-month businesses spending a fraction of what human staffing would cost, signaling a major disruption ahead.

-  Why E-Commerce Is Primed for AI Disruption

AI in E-Com Customer Service: The Efficiency Gains 0:00

- Customer service is described as one of the most **under-talked-about** areas where AI is creating huge efficiency lifts in e-commerce
- Arie references firsthand experience as an insider with a tool called **SmartReply**
 - SmartReply handles customer service on social media, ads on TikTok Shop, and Gmail
- Large brands are seeing dramatic cost reductions:
 - Seven-figure-per-month brands and at least one eight-figure-per-month brand cited as real examples
 - These brands are spending roughly **a quarter of the cost of a single employee** to manage all those channels via AI
 - Without AI, managing the same channels would require at least **5–10 human employees**
 - Reason: high inbound volumes demand round-the-clock, 24/7 support

Why E-Commerce Is Primed for AI Disruption 0:46

- Arie expresses strong excitement about AI's future impact on e-commerce specifically
- The presence of **physical products that must be shipped** is highlighted as a key differentiator
 - This operational complexity generates large volumes of customer inquiries (tracking, returns, shipping issues, etc.), making AI assistance especially valuable

"The fact that we have physical products that we have to ship makes e-commerce one of the best sectors for AI to disrupt."

- The overall takeaway: AI-driven customer service is already delivering measurable, significant ROI in e-com — and it's still early
