The cheat code to losing 10 lbs. in 30 days.

Channel: Brandon Carter · Published: Oct 18, 2026 · Watch: https://www.youtube.com/shorts/gK80dPLX7YI Source: full transcript

📋 Executive Summary

Walk 20,000 steps per day, strategically spread throughout the day in small chunks, as a low-intensity "cheat code" to lose 10 lbs in 30 days without needing a gym or intense workout sessions.

📑 Contents

- 🎯 The Goal and the Method
- 🗓️ The Daily Step Schedule
- ⏰ The Cheat Code: Hourly Walks at Work
- ⚠️ Why Space It Out

🎯 The Goal and the Method 0:00

- Target: lose **10 lbs in 30 days** by walking 20,000 steps per day
- The approach is framed as "deliberately turning up the NEAT" (Non-Exercise Activity Thermogenesis)
- Pre-empts common objections — school, work, kids, busy schedule — by providing a structured time-blocked plan

🗓️ The Daily Step Schedule 0:00

- A breakdown of how to accumulate 20,000 steps across existing daily routines:

Time of Day	Activity	Duration	Steps Earned
Morning (wake up)	Walk immediately	30 minutes	~3,000 steps
Lunch break	Eat for 30 min, walk for 30 min	30 minutes walking	~3,000 steps
After work	Walk	1 hour	~6,000 steps
During work (hourly)	Walk around office/block	10 min × ~8 hrs	~8,000 steps

- Total adds up to approximately **20,000 steps per day**

⏰ The Cheat Code: Hourly Walks at Work 0:22

- **Set an alarm every hour during work hours** and walk for 10 minutes each time
  - Walk around the office, around the block — any movement counts

    - This is described as the actual "cheat code" that bridges the step gap
- Addresses the objection "I'll get fired if I walk around"
    - Response (verbatim): *"We is free. Master can't make you stay at your desk."*
    - Suggests that if your job keeps you chained to a desk with no flexibility, it may be worth reconsidering that career
    - Acknowledges not everyone can do it this way and encourages finding alternative solutions

⚠️ Why Space It Out 0:46

- Spreading the 20,000 steps across the full day is intentional — not just convenient
    - If you try to do all 20,000 steps in a single session, your body may need recovery time afterward
    - Breaking it into smaller chunks keeps it sustainable and avoids fatigue or soreness that would derail consistency
